Datasheet for Telink BLE SoC TLSR8266

DS-TLSR8266-E31

Ver 3.2.0

2018/9/11

Keyword:

Features; Package; Pin layout; Working mode; Memory; MCU; RF Transceiver; Baseband; Clock; Timers; Interrupt; Interface; PWM; KeyScan; QDEC; ADC; PGA; Electrical specification; Application

Brief:

This datasheet is dedicated for Telink BLE SoC TLSR8266 (without internal flash) / TLSR8266F512 (with internal 512K flash)/TLSR8266F128 (with internal 128K flash)/ TLSR8266F1k (with internal 1024k flash). In this datasheet, key features, working mode, main modules, electrical specification and application of the TLSR8266/TLSR8266F512/TLSR8266F128/TLSR8266F1K are introduced.

Revision History

Version	Major Changes	Date	Author
0.8	Preliminary release	2014/3	Cynthia
1.0	Mainly added section 11~13, and updated section 1, 7, 10, 14. Added TLSR8266ET48 package.	2014/5	Cynthia
1.01	Updated section 14.4	2014/5	Cynthia
1.1	Updated section 15	2014/5	Cynthia
1.2	Mainly updated section 1 and section 15	2014/7	Cynthia
1.3	Updated section 4	2014/7	Cynthia
1.4	Mainly updated section 1, section 6 and section 15	2014/8	Cynthia
1.41	Updated section 14.3	2014/8	Cynthia
1.42	Updated section 1 and section 3	2014/8	Cynthia
1.5	Updated section 8	2014/10	Cynthia
1.6	Added section 2.5, updated section 7.1 and 7.3	2015/1	S.G.J., Cynthia
1.7	Updated section 2.3	2015/1	S.G.J., Cynthia
1.71	Updated section 14.4	2015/3	Cynthia
1.8	Updated section 2.5, 4.4.2, 5, 7.1.3, 7.4, 12 and 14.4	2015/3	Cynthia
1.9	Updated section 1 and 14.2	2015/3	Cynthia
1.91	Updated section 12.5~12.6 and 12.9	2015/4	Cynthia
2.0	Updated section 1.6 and 7.1	2015/4	S.G.J., Cynthia
2.01	Mainly updated section 1.6, 7.1.1.2 and 12.3 Modified Figure 13-1	2015/5	L.L.J., Cynthia
2.0.2	Updated package dimension figures (Figure 1-2~1-4 in section 1.5)	2015/6	X.S.J., Cynthia
2.1.0	Marked ANA_D<4> and ANA_D<5> as input and output pins for 32K crystal; Updated connection relationship between GPIO and related modules; Updated Tx power.	2016/2	S.G.J., L.Y., Cynthia

Version	Major Changes	Date	Author
2.2.0	Added TLSR8266F64ET24 package information; Added TLSR8266F512/TLSR8266F64 Flash features; Added reference design for TLSR8266F512ET32 and TLSR8266F64ET24.	2016/5	X.S.J., W.W.X., T.J.B., L.X., Cynthia
2.3.0	Updated recommended VDD range, DC characteristics, ordering information and reference design; Replaced TLSR8266F64 by TLSR8266F128; Updated Note (3) for GPIO lookup table.	2016/7	L.X., L.W.H., L.J.R., X.S.J., Cynthia
2.4.0	Added Unique ID feature for TLSR8266F128 internal 128K Flash encryption protection.	2016/9	H.Z.T., Cynthia
2.5.0	Added I2C and SPI usage. Added pull-up resistor statement for I2C.	2016/10	Z.X.D., S.G.J., Cynthia
2.6.0	Modified I2C Master clock.	2016/12	Y.C.Q., Cynthia
2.7.0	Updated ordering information.	2017/3	X.S.J., Cynthia
2.8.0	Updated section 7.3.1 Communication protocol.	2017/6	S.G.J., Cynthia
2.9.0	Updated section 1.6 Pin layout.	2017/6	Cynthia
3.0.0	Updated section 1.2.2 RF Features and 3.3 Baseband.	2017/8	J.H.P., Cynthia
3.1.0	Updated the following sections: 4.3 System clock (0x66[4:0]), 7.1.1.3 GPIO lookup table (notes), 13.2 Recommended operating condition (supply rise time), 14 Applications. Removed audio function including DMIC, AMIC and SDM.	2017/12	J.H.P., X.W.W., L.X., Cynthia
3.2.0	Updated section 1.4 Ordering information, Added TLSR8266F1KET32 package.	2018/9	YHL, Cynthia

1 Overview

The TLSR8266/TLSR8266F512/TLSR8266F128/TLSR8266F1K is Telink-developed BLE SoC solution which is fully standard compliant and allows easy connectivity with Bluetooth Smart Ready mobile phones, tablets, laptops. The TLSR8266/TLSR8266F512/TLSR8266F128/TLSR8266F1K supports BLE slave and master mode operation, including broadcast, encryption, connection updates, and channel map updates. It's completely RoHS-compliant and 100% lead (Pb)-free.

1.1 Block diagram

The TLSR8266/TLSR8266F512/TLSR8266F128/TLSR8266F1K is designed to offer high integration, ultra-low power application capabilities. It integrates strong 32-bit MCU, BLE/2.4GHz Radio, 16kB SRAM, 128/256/512kB external FLASH (TLSR8266) or 512kB internal Flash (TLSR8266F512) or 128kB internal Flash (TLSR8266F128) or 1024kB internal Flash (TLSR8266F1K), 14bit ADC with PGA, 6-channel PWM, three quadrature decoders, a hardware keyboard scanner (Keyscan), abundant GPIO interfaces, multi-stage power management module and nearly all the peripherals needed for Bluetooth Low Energy applications development.

The system's block diagram is as shown in Figure 1- 1:

Telink for customer

Distribuída no Brasil pela LRI | vendas@lri.com.br | 51 2129-3000

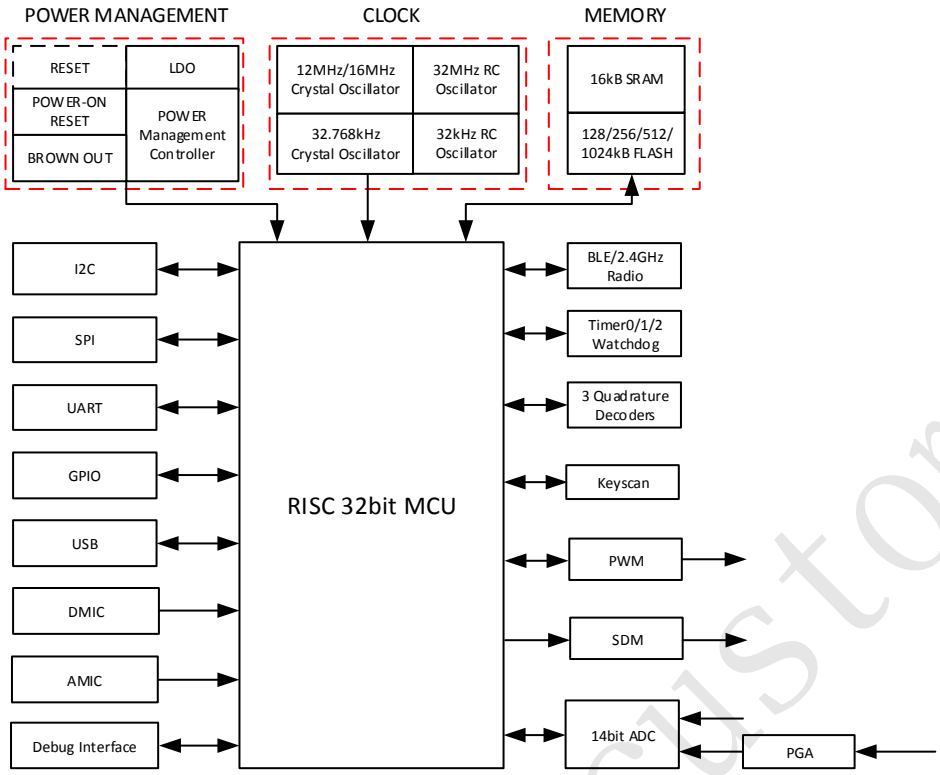

Figure 1- 1 Block diagram of the system

With the high integration level of TLSR8266/TLSR8266F512/TLSR8266F128/TLSR8266F1K, few external components are needed to satisfy customers' ultra-low cost requirements.

1.2 Key features

1.2.1 General features

General features are as follows:

1) Embed 32-bit high performance MCU with clock up to 48MHz.
2) Program memory: external 128/256/512kB FLASH (TLSR8266) or internal 512kB Flash (TLSR8266F512) or internal 128kB Flash (TLSR8266F128) or internal 1024kB Flash (TLSR8266F1K).
3) Data memory: 16kB on-chip SRAM.
4) 12MHz/16MHz & 32.768kHz Crystal and 32kHz/32MHz embedded RC oscillator.

Telink for customer

Distribuída no Brasil pela LRI | vendas@lri.com.br | 51 2129-3000

5) A rich set of I/Os:
   - ✧ TLSR8266: Up to 41/37/22 GPIOs depending on package option;
   - ✧ TLSR8266F512: Up to 35/20 GPIOs depending on package option;
   - ✧ TLSR8266F128: Up to 12 GPIOs;
   - ✧ TLSR8266F1K: Up to 20 GPIOs;
   - ✧ SPI;
   - ✧ I2C;
   - ✧ UART;
   - ✧ USB;
   - ✧ Debug Interface.
6) Up to 6 channels of PWM.
7) Sensor:
   - ✧ 14bit ADC with PGA;
   - ✧ Temperature sensor.
8) Three quadrature decoders.
9) Embeds hardware AES.
10) Compatible with USB2.0 Full speed mode.
11) TLSR8266 & TLSR8266F512 operating temperature range:
   - ✧ ET versions: -40℃~+85℃ temperature;
   - ✧ AT versions: -40℃~+125℃ temperature.
12) TLSR8266F128 operating temperature range: -40℃~+85℃.
13) TLSR8266F1K operating temperature range: -40℃~+85℃.

1.2.2 RF Features

RF features include:

1) BLE/2.4GHz RF transceiver embedded, working in worldwide 2.4GHz ISM band.
2) Bluetooth 4.2 Compliant, 1Mbps and 2.4GHz 2Mbps Boost Mode.
3) Rx Sensitivity: -92dBm @ 1Mbps mode.

Telink for customer

Distribuída no Brasil pela LRI | vendas@lri.com.br | 51 2129-3000

4) RF link data rate up to 2Mbps.
5) Tx output power: +7dBm.
6) Single-pin antenna interface.
7) RSSI monitoring.

1.2.3 Features of power management module

Features of power management module include:

1) Embedded LDO.
2) Battery monitor: Supports low battery detection.
3) Chip power supply: 1.9V~3.6V (with external flash), 2.7V~3.6V (with internal flash)
4) Multiple stage power management to minimize power consumption.
5) Low power consumption:
   - ✧ Receiver mode current: 13mA
   - ✧ Transmitter mode current: 13mA @ 0dBm power, 19mA @ max power
   - ✧ Suspend mode current: 20uA (IO wakeup)/22uA (Timer wakeup)
   - ✧ Deep sleep mode current: 0.7uA

1.2.4 TLSR8266F512/TLSR8266F128/TLSR8266F1K Flash features

The TLSR8266F512/TLSR8266F128/ TLSR8266F1K embeds Flash with features below:

1) TLSR8266F512 Flash: Total 512kB (4Mbits);
2) TLSR8266F128 Flash: Total 128kB (1Mbits);
3) TLSR8266F1K Flash: Total 1024kB (8Mbits);
4) Flexible architecture: 4kB per Sector, 64kB/32kB per block;
5) Up to 256 Bytes per programmable page;
6) Write protect all or portions of memory;
7) Sector erase (4kB);
8) Block erase (32kB/64kB);
9) Cycle Endurance: 100,000 program/erases;
10) Data Retention: typical 20-year retention;

Telink for customer

Distribuída no Brasil pela LRI | vendas@lri.com.br | 51 2129-3000

11) TLSR8266F128 Flash encryption protection: Pre-loaded read-only unique ID for chip identification and traceability.

1.3 Typical applications

Typical applications for the TLSR8266/TLSR8266F512/TLSR8266F128/ TLSR8266F1K are as follows:

- ✧ Smartphone accessories
- ✧ PC and tablet peripherals, including Mouse / Keyboard
- ✧ Remote Control and 3D glasses
- ✧ Wireless Microphone
- ✧ Health monitoring
- ✧ Sports and fitness tracking
- ✧ Wearable devices

1.4 Ordering information

Table 1- 1 Ordering information of TLSR8266/TLSR8266F512/TLSR8266F128/TLSR8266F1K

Product Series	Package Type	Temperature Range	Product Part No.	Packing Method	Minimum Order Quantity
TLSR8266	56-pin 7×7mm TQFN	-40℃~+85℃	TLSR8266ET56	TR	3000
		-40℃~+125℃	TLSR8266AT56	TR	3000
	48-pin 7×7mm TQFN	-40℃~+85℃	TLSR8266ET48	TR	3000
		-40℃~+125℃	TLSR8266AT48	TR	3000
	32-pin 5×5mm TQFN	-40℃~+85℃	TLSR8266ET32	TR	3000
		-40℃~+125℃	TLSR8266AT32	TR	3000

1.6 Pin layout

Pin assignment for the TLSR8266ET/AT56 is as shown in Figure 1- 6:

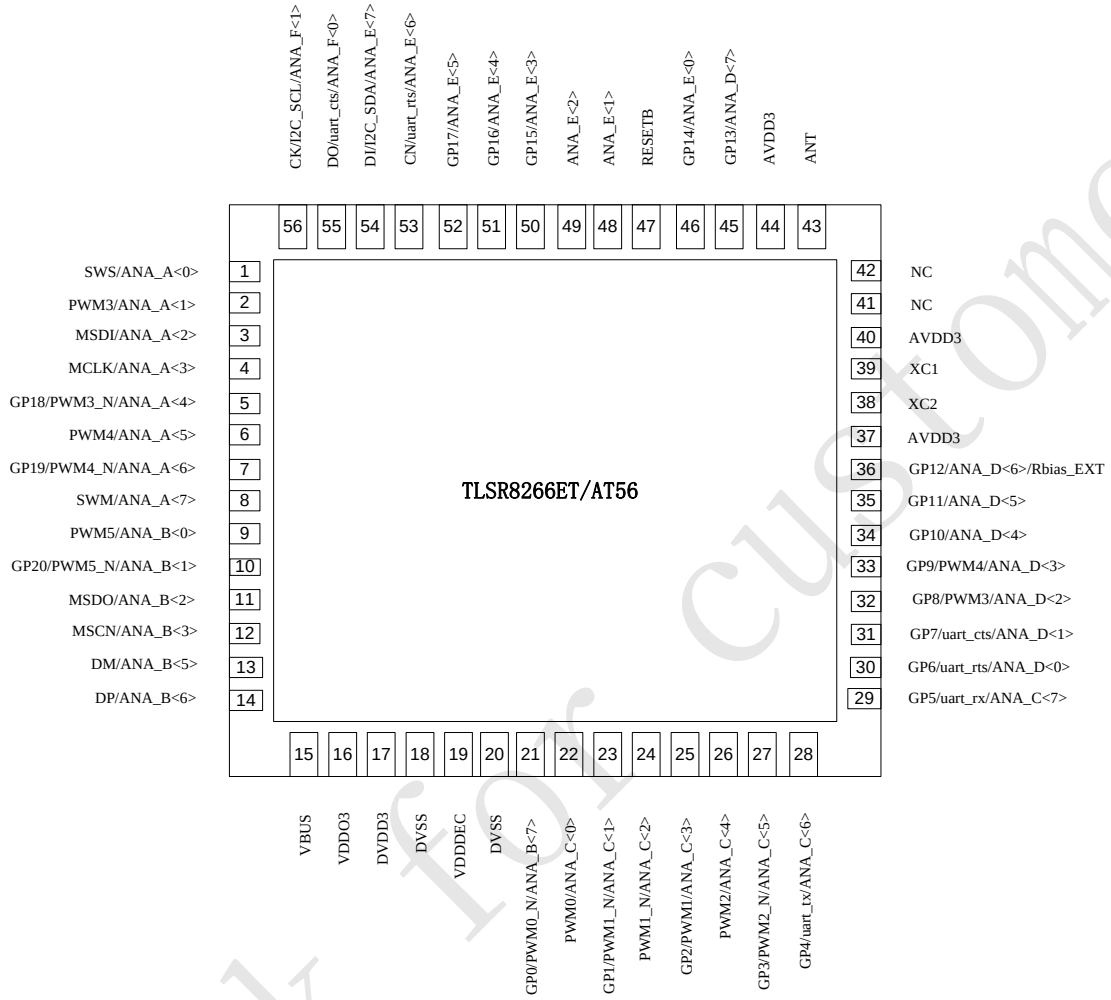

Figure 1- 6 Pin assignment for the TLSR8266ET/AT56

Functions of 56pins for the TLSR8266ET/AT56 are described in Table 1-2:

Table 1- 2 Pin functions for the TLSR8266ET/AT56

QFN56 7X7			
No.	**Pin Name**	**Type**	**Description**
1	**SWS/ANA_A<0>**	Digital I/O	Single wire slave/GPIO/ANA_A<0>
2	**PWM3/ANA_A<1>**	Digital I/O	PWM3 output/GPIO/ ANA_A<1>
3	**MSDI/ANA_A<2>**	Digital I/O	Memory SPI data input/GPIO/ANA_A<2>
4	**MCLK/ANA_A<3>**	Digital I/O	Memory SPI clock/GPIO/ANA_A<3>
5	**GP18/PWM3_N/ANA_A<4>**	Digital I/O	GPIO18/PWM3 inverting output/ANA_A<4>
6	**PWM4/ANA_A<5>**	Digital I/O	PWM4 output/GPIO/ANA_A<5>

53	**CN/uart_rts/ANA_E<6>**	Digital I/O	SPI chip select. Active low/ UART_RTS /GPIO/ ANA_E<6>
54	**DI/I2C_SDA/ANA_E<7>**	Digital I/O	SPI data input/I2C_SDA/GPIO/ ANA_E<7>
55	**DO/uart_cts/ANA_F<0>**	Digital I/O	SPI data output/ UART_CTS /GPIO/ ANA_F<0>
56	**CK/I2C_SCL/ANA_F<1>**	Digital I/O	SPI clock/I2C_SCK/GPIO/ ANA_F<1>

*Note:

1) Pins with bold typeface can be used as GPIOS. All GPIOs have configurable pull-up/pull-down resistor.

2) Pin drive strength: All pins support drive strength up to 4mA (4mA when “DS”=1, 0.7mA when “DS”=0) with the following exceptions: ANA_B<6> and ANA_B<5> support high drive strength up to 8mA (8mA when “DS”=1, 4mA when “DS”=0); ANA_E<5> and ANA_E<4> support high drive strength up to 16mA (16mA when “DS”=1, 12mA when “DS”=0). “DS” configuration will take effect when the pin is used as output. Please refer to section 7.1 for corresponding “DS” register address and the default setting.

3) Selectable ADC input channels: ANA_C<2>~ANA_C<7>, ANA_D<0>~ANA_D<5>.

2 Memory and MCU

2.1 Memory

The TLSR8266/TLSR8266F512/TLSR8266F128/TLSR8266F1K embeds 16kB data memory (SRAM), 128/256/512kB external FLASH (TLSR8266) or 512kB internal FLASH (TLSR8266F512) or 128kB internal FLASH (TLSR8266F128) or 1024kB internal FLASH (TLSR8266F1K).

2.1.1 SRAM/Register

SRAM/Register memory map is shown as follows:

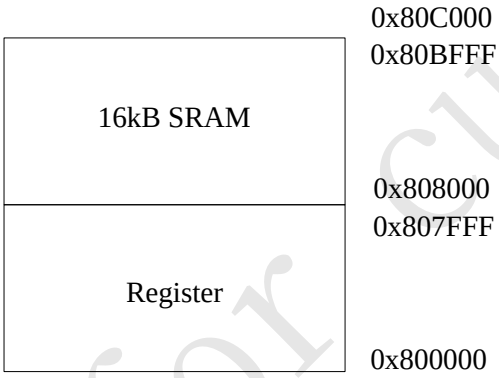

Figure 2- 1 Physical memory map

Register address: from 0x800000 to 0x807FFF;

16kB SRAM address: from 0x808000 to 0x80C000.

Both register and 16kB SRAM address can be accessed via debugging interface (SPI/I2C/USB, SWS/SWM interface).

2.1.2 Flash

External Flash address can be accessed via MSPI interface.

The internal Flash mainly supports page program, sector/block/chip erase operations, and deep power down operation.

Telink for customer

Distribuída no Brasil pela LRI | vendas@lri.com.br | 51 2129-3000

2.1.2.1 Page program

The page program mode allows up to 256 bytes data to be programmed at memory locations that have been erased.

2.1.2.2 Sector erase

The sector erase operation serves to erase all the data of the specified sector (4kB) to all 1s.

2.1.2.3 Block erase

The block erase operation serves to erase all the data of the specified block (32kB or 64kB) to all 1s.

2.1.2.4 Chip erase

The chip erase operation serves to erase data at all memory locations to all 1s.

2.1.2.5 Unique ID

For chip identification and traceability, the 128kB Flash of TLSR8266F128 is preloaded with 8-byte hexadecimal Unique ID (UID). User is not allowed to modify this preloaded UID with write protection, but can read the UID via corresponding API interface.

2.2 MCU

The TLSR8266/TLSR8266F512/TLSR8266F128/TLSR8266F1K integrates a powerful 32-bit MCU developed by Telink. The digital core is based on 32-bit RISC, and the length of instructions is 16 bits; four hardware breakpoints are supported.

2.3 Working modes

The TLSR8266/TLSR8266F512/TLSR8266F128/TLSR8266F1K has four working modes: Active, Idle, Suspend and Deep Sleep. This section mainly gives the description of every working mode and mode transition.

Telink for customer

Distribuída no Brasil pela LRI | vendas@lri.com.br | 51 2129-3000

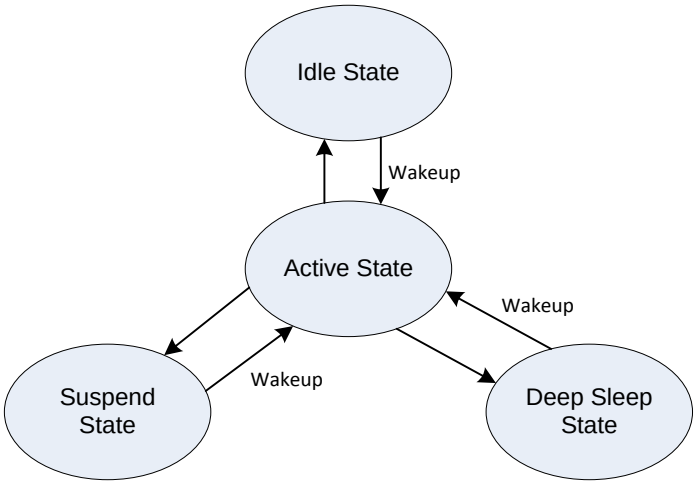

Figure 2- 2 Transition chart of working modes

2.3.1 Active mode

In active mode, the MCU block is at working state, and the TLSR8266/TLSR8266F512/TLSR8266F128/TLSR8266F1K can transmit or receive data via its embedded RF transceiver. The RF transceiver can also be powered down if no data transfer is needed.

2.3.2 Idle mode

In Idle mode, the MCU block stalls, and the RF transceiver can be at working state or be powered down. The time needed for the transition from Idle mode to Active mode is negligible.

2.3.3 Power-saving mode

For the TLSR8266/TLSR8266F512/TLSR8266F128/TLSR8266F1K, there are two kinds of power-saving modes: suspend mode and deep sleep mode. The two modes have similar transition sequences but different register settings. For 1.8V digital core, it's still provided with the working power by 1.8V LDO in suspend mode; while in deep sleep mode, the 1.8V LDO will be turned off, and the digital core is powered down.

In suspend mode, the RF transceiver is powered down, and the clock of the MCU block is stopped. It only takes about 400us for the TLSR8266/TLSR8266F512/TLSR8266F128/TLSR8266F1K to enter the active mode from

Telink for customer

Distribuída no Brasil pela LRI | vendas@lri.com.br | 51 2129-3000

suspend mode.

While in deep sleep mode, both the RF transceiver and the MCU block are powered down with only power management block being active. The transition time needed from deep sleep mode to active mode is 1ms, almost the same as power-up time.

2.4 Reset, Wakeup and Power down enabling

Table 2- 1 Register configuration for reset, wakeup and power down enabling

Address	Mnemonic	Type	Description	Reset Value
0x60	RST0	R/W	Reset control, 1 for reset, 0 for clear [0] : SPI [1] : I2C [2]: USB [3]: rsvd [4]: MCU [5]: mac [6]: AIF [7]: zb	00
0x61	RST1	R/W	[0] system_timer [1]algm [2]dma [3]rs232 [4]pwm0 [5]aes [6]bbpll48m [7]swires	df
0x62	RST2	R/W	[0]sbc [1]rsvd [2]dfifo [3]adc [4]mcic [5]soft reset to reset mcic enable [6]mspi [7] algs	00
0x6e	WAKEUPEN	R/W	Wakeup enable [0]: enable wakeup from I2C host	00

Telink for customer

Distribuída no Brasil pela LRI | vendas@lri.com.br | 51 2129-3000

Address	Mnemonic	Type	Description	Reset Value
			[1]: enable wakeup from SPI host [2]: enable wakeup from USB [3]: enable wakeup from gpio [4]: enable wakeup from I2C synchronous interface System resume control [5]: enable GPIO remote wakeup [6]: if set to1, system will issue USB resume signal on USB bus [7]: sleep wakeup reset system enable	
0x6f	PWDNEN	W	[0]: suspend enable [5]:rst all (act as power on reset) [6]:mcu low power mode [7]: stall mcu trig If bit[0] set 1, then system will go to suspend. Or only stall mcu	

Except for power on reset, it is also feasible to carry out software reset for the whole chip or some modules. Setting address 0x6f[5] to 1b'1 is to reset the whole chip. Addresses 0x60~0x62 serve to reset individual modules: if some bit is set to logic "1", the corresponding module is reset. Address 0x6e serves to enable various wakeup sources from power-saving mode.

Telink for customer

2.5 Wakeup sources

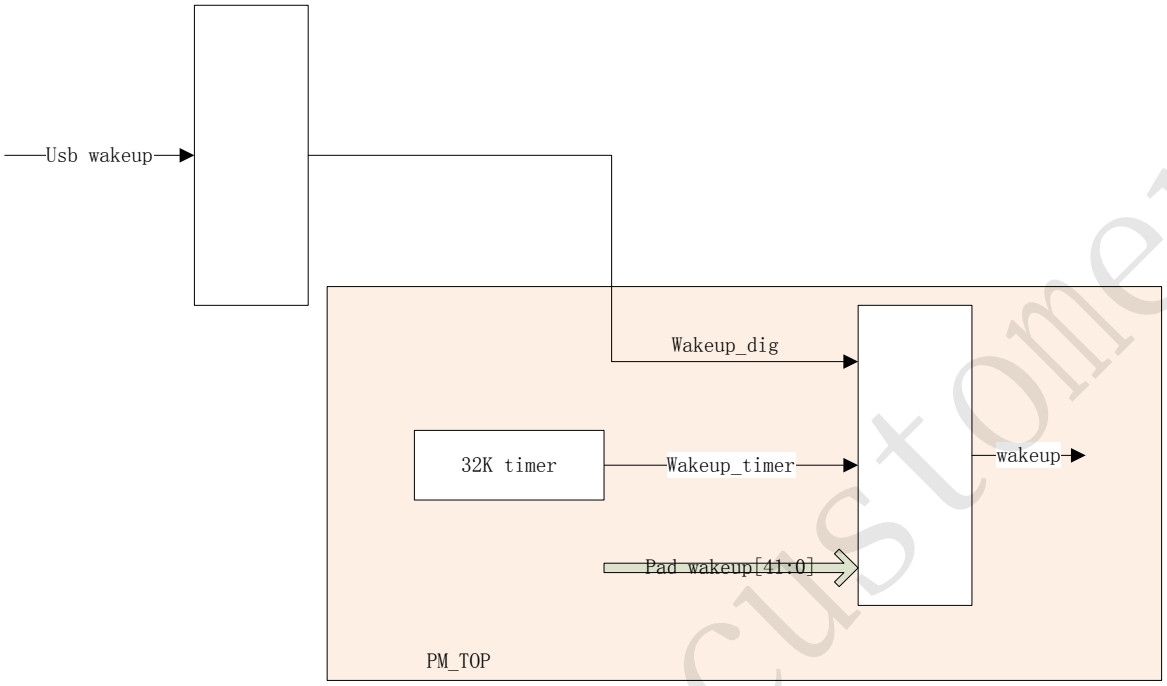

Figure 2- 3 Wakeup sources

2.5.1 Wakeup source - USB

This wakeup source can only wake up the system from suspend mode.

First, set the digital core address 0x6e bit [2] to 1.

To activate this mode, 3V_reg38 bit[5] should also be set to 1.

Once USB host sends out resuming signal, the system will be wake up.

2.5.2 Wakeup source – 32kHz timer

This wakeup source is able to wake up the system from suspend mode or deep sleep mode.

Address 3V_reg38 bit[6] is the enabling bit for wakeup source from 32kHz timer.

2.5.3 Wakeup source – pad

This wakeup source is able to wake up the system from suspend mode or deep

Telink for customer

Distribuída no Brasil pela LRI | vendas@lri.com.br | 51 2129-3000

sleep mode. And Pad wakeup supports high level or low level wakeup which is configurable via polarity control registers.

Enabling control registers: Pad PA[7:0] enabling control register is 3V_reg39[7:0], Pad PB[7:0] enabling control register is 3V_reg40[7:0], Pad PC[7:0] enabling control register is 3V_reg41[7:0], Pad PD[7:0] enabling control register is 3V_reg42[7:0], Pad PE[7:0] enabling control register is 3V_reg43[7:0], Pad PF[1:0] enabling control register is 3V_reg38[3:2]. Total wakeup pin can be up to 42.

Polarity control registers: Pad PA[7:0] polarity control register is 3V_reg33[7:0], Pad PB[7:0] polarity control register is 3V_reg34[7:0], Pad PC[7:0] polarity control register is 3V_reg35[7:0], Pad PD[7:0] polarity control register is 3V_reg36[7:0], Pad PE[7:0] polarity control register is 3V_reg37[7:0], and Pad PF[1:0] polarity control register is 3V_reg38[1:0].

Table 2- 2 Analog registers for Wakeup

3 2.4G RF Transceiver

3.1 Block diagrams

The TLSR8266/TLSR8266F512/TLSR8266F128/TLSR8266F1K integrates an advanced 2.4GHz RF transceiver. The RF transceiver works in the worldwide 2.4GHz ISM (Industrial Scientific Medical) band and contains an integrated balun with a single-ended RF Tx/Rx port pin. No matching components are needed.

The transceiver consists of a fully integrated frequency synthesizer, a power amplifier, a modulator and a receiver. The transceiver can be configured to work in standard-compliant BLE mode and can also be configured to work in proprietary 2Mbps mode. All modes support FSK/GFSK modulations.

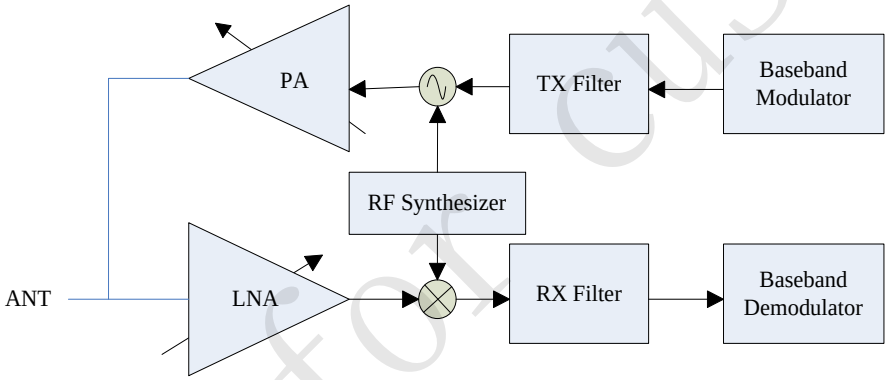

Figure 3- 1 Block diagram of RF transceiver

The internal PA can deliver a typical 7dBm output power, avoiding the needs for an external RF PA.

3.2 Function description

3.2.1 Turn on/off

For the sake of saving power, the transceiver can be turned on/off via the software. Setting the address 0x7c bit[6] to 1 enables the RF transceiver, while clearing the bit totally disables the RF transceiver.

3.2.2 Air interface data rate and RF channel frequency

Air interface data rate, the modulated signaling rate for RF transceiver when

Telink for customer

Distribuída no Brasil pela LRI | vendas@lri.com.br | 51 2129-3000

transmitting and receiving data, is configurable via related register setting: 1Mbps, 2Mbps are available for the TLSR8266/TLSR8266F512/TLSR8266F128/TLSR8266F1K.

For the TLSR8266/TLSR8266F512/TLSR8266F128/TLSR8266F1K, RF transceiver can operate with frequency ranging from 2.400GHz to 2.4835GHz. The RF channel frequency setting determines the center of the channel.

3.3 Baseband

The baseband contains dedicated hardware logic to perform fast AGC control, access code correlation, CRC checking, data whitening, encryption/decryption and frequency hopping logic.

The baseband supports all features required by Bluetooth v4.2 specification.

3.3.1 Packet format

Packet format is shown as Table 3-1:

Table 3- 1 Packet Format

LSB MSB

Preamble (1 octet)	Access Address (4 octets)	PDU (2 to 39 octets)	CRC (3 octets)

Packet length 80bit ~ 376bit (80~376us @ 1Mbps).

3.3.2 RSSI

The TLSR8266/TLSR8266F512/TLSR8266F128/TLSR8266F1K provides accurate RSSI (Receiver Signal Strength Indicator) indication which can be read on per packet basis.

Telink for customer

4 Clock

4.1 Clock sources

The TLSR8266/TLSR8266F512/TLSR8266F128/TLSR8266F1K embeds a 32MHz RC oscillator which can be used as clock source for system and ADC. A 32kHz RC oscillator is also embedded to provide clock source for sleep state.

Other than the RC clock source, PLL generates a 192MHz clock source and a 48MHz clock source, which can be used as clock sources for system and ADC.

External 12M/16M crystal is available via pin XC1, which provide a 12MHz/16MHz clock source for system and ADC. External 32kHz crystal is available via pin ANA_D<4>, which can provide a 32kHz clock source for system.

4.2 Register table

Table 4- 1 Register table for clock

Address	Mnemonic	Type	Description	Reset Value
0x63	CLKEN0	R/W	Clock enable control: 1 for enable; 0 for disable [0] : SPI [1] : I2C [2]: USB [3]: USB PHY [4]: MCU [5]: mac [6]: AIF [7]: zb	8c

4.3 System clock

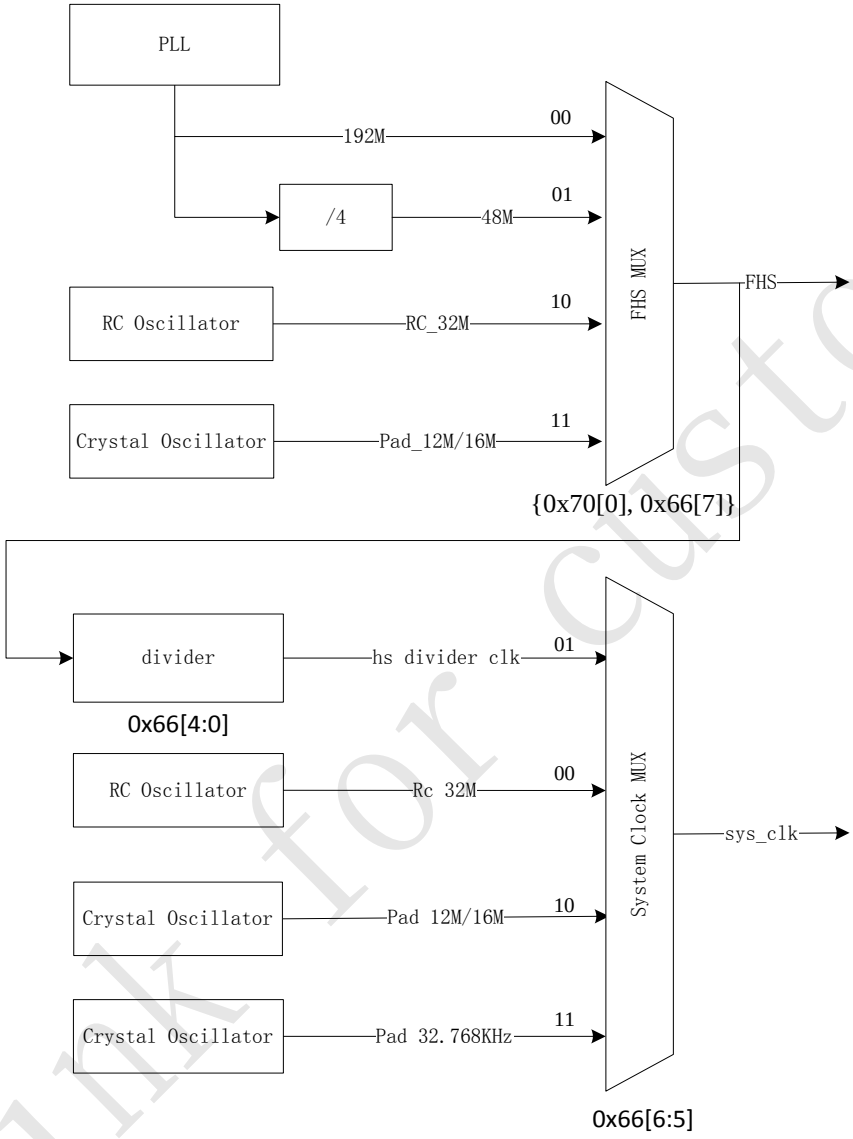

Figure 4- 1 Block diagram of system clock

There are four selectable clock sources for MCU system clock: 32MHz RC clock, HS divider clock (divided from a High speed clock), and Pad clock (12MHz/16MHz, 32.768kHz).

The high speed clock (FHS) is selectable via address {0x70[0], 0x66[7]} from the following sources: 192MHz clock from PLL, 48MHz clock from PLL, 32MHz RC clock, and 12MHz/16MHz Pad clock.

Telink for customer

Distribuída no Brasil pela LRI | vendas@lri.com.br | 51 2129-3000

Register CLKSEL (address 0x66) serves to set system clock. System clock source is selectable via bit[6:5]. If address 0x66[6:5] is set to 2b'01 to select the HS divider clock, system clock frequency is adjustable via address 0x66[4:0]. $F_{System\ clock}$ = F_{FHS} / (system clock divider value in address 0x66[4:0]).

4.4 Module clock

Registers CLKEN0~CLKEN2 (address 0x63~0x65) are used to enable or disable clock for various modules. By disable the clocks of unused modules, current consumption could be reduced.

4.4.1 ADC clock

ADC clock derives from FHS. ADC clock is enabled via setting address 0x6b[7] to 1b'1.

ADC clock frequency dividing factor contains step and mod. Address 0x6b[6:4] and 0x69 serve to set ADC clock step[10:0]. Address 0x6b[3:0] and 0x6a serve to set ADC clock mod[11:0].

ADC clock frequency, $F_{ADC\ clock}$, equals to F_{FHS}* step[10:0] / mod[11:0].

5 Timers

5.1 Timer0~Timer2

The TLSR8266/TLSR8266F512/TLSR8266F128/TLSR8266F1K supports three timers: Timer0~ Timer2. The three timers all support four modes: Mode 0 (System Clock Mode), Mode 1 (GPIO Trigger Mode), Mode 2 (GPIO Pulse Width Mode) and Mode 3 (Tick Mode).

Timer 2 can also be configured as “watchdog” to monitor firmware running.

5.1.1 Register table

Table 5- 1 Register configuration for Timer0~Timer2

Address	Mnemonic	Type	Description	Reset Value
0x620	TMR_CTRL0	RW	[0]Timer0 enable [2:1] Timer0 mode. 0 using sclk, 1, using gpio, 2 count widht of gpi, 3 tick [3]Timer1 enable [5:4] Timer1 mode. [6]Timer2 enable [7]Bit of timer2 mode	00

5.1.2 Mode0 (System Clock Mode)

In Mode 0, system clock is employed as clock source.

After Timer is enabled, Timer Tick (i.e. counting value) is increased by 1 on each positive edge of system clock from preset initial Tick value. Generally the initial Tick value is set to 0.

Once current Timer Tick value matches the preset Timer Capture (i.e. timing value), an interrupt is generated, Timer stops counting and Timer status is updated.

Steps of setting Timer0 for Mode 0 is taken as an example.

1st: Set initial Tick value of Timer0

Set Initial value of Tick via registers TMR_TICK0_0~TMR_TICK0_3 (address 0x630~0x633). Address 0x630 is lowest byte and 0x633 is highest byte. It's recommended to clear initial Timer Tick value to 0.

2nd: Set Capture value of Timer0

Set registers TMR_CAPT0_0~TMR_CAPT0_3 (address 0x624~0x627). Address 0x624 is lowest byte and 0x627 is highest byte.

3rd: Set Timer0 to Mode 0 and enable Timer0

Set register TMR_CTRL0 (address 0x620) [2:1] to 2b'00 to select Mode 0; Meanwhile set address 0x620[0] to 1b'1 to enable Timer0. Timer0 starts counting upward, and Tick value is increased by 1 on each positive edge of system clock until it reaches Timer0 Capture value.

5.1.3 Mode1 (GPIO Trigger Mode)

In Mode 1, GPIO is employed as clock source. The "**m0**"/"**m1**"/"**m2**" register specifies the GPIO which generates counting signal for Timer0/Timer1/Timer2.

After Timer is enabled, Timer Tick (i.e. counting value) is increased by 1 on each positive/negative (configurable) edge of GPIO from preset initial Tick value. Generally the initial Tick value is set to 0. The "**Polarity**" register specifies the GPIO edge when Timer Tick counting increases.

Note: Refer to **Section 7.1.2** for corresponding "**m0**", "**m1**", "**m2**" and "**Polarity**"

Telink for customer

Distribuída no Brasil pela LRI | vendas@lri.com.br | 51 2129-3000

register address.

Once current Timer Tick value matches the preset Timer Capture (i.e. timing value), an interrupt is generated and timer stops counting.

Steps of setting Timer1 for Mode 1 is taken as an example.

1st: Set initial Tick value of Timer1

Set Initial value of Tick via registers TMR_TICK1_0~TMR_TICK1_3 (address 0x634~0x637). Address 0x634 is lowest byte and 0x637 is highest byte. It's recommended to clear initial Timer Tick value to 0.

2nd: Set Capture value of Timer1

Set registers TMR_CAPT1_0~TMR_CAPT1_3 (address 0x628~0x62b). Address 0x628 is lowest byte and 0x62b is highest byte.

3rd: Select GPIO source and edge for Timer1

Select certain GPIO to be the clock source via setting "m1" register.

Select positive edge or negative edge of GPIO input to trigger Timer1 Tick increment via setting "Polarity" register.

4th: Set Timer1 to Mode 1 and enable Timer1

Set address 0x620[5:4] to 2b'01 to select Mode 1; Meanwhile set address 0x620[3] to 1b'1 to enable Timer1. Timer1 starts counting upward, and Timer1 Tick value is increased by 1 on each positive/negative (specified during the 3rd step) edge of GPIO until it reaches Timer1 Capture value.

5.1.4 Mode2 (GPIO Pulse Width Mode)

In Mode 2, system clock is employed as the unit to measure the width of GPIO pulse. The "**m0**"/"**m1**"/"**m2**" register specifies the GPIO which generates control signal for Timer0/Timer1/Timer2.

After Timer is enabled, Timer Tick is triggered by a positive/negative (configurable) edge of GPIO pulse. Then Timer Tick (i.e. counting value) is increased by 1 on each positive edge of system clock from preset initial Tick value. Generally the initial Tick value is set to 0. The "**Polarity**" register specifies the GPIO edge when Timer Tick starts counting.

Telink for customer

Distribuída no Brasil pela LRI | vendas@lri.com.br | 51 2129-3000

Note: Refer to **Section 7.1.2** for corresponding "**m0**", "**m1**", "**m2**" and "**Polarity**" register address.

While a negative/positive edge of GPIO pulse is detected, an interrupt is generated and timer stops counting. The GPIO pulse width could be calculated in terms of tick count and period of system clock.

Steps of setting Timer2 for Mode 2 is taken as an example.

1st: Set initial Timer2 Tick value

Set Initial value of Tick via registers TMR_TICK2_0~TMR_TICK2_3 (address 0x638~0x63b). Address 0x638 is lowest byte and 0x63b is highest byte. It's recommended to clear initial Timer Tick value to 0.

2nd: Select GPIO source and edge for Timer2

Select certain GPIO to be the clock source via setting "m2" register.

Select positive edge or negative edge of GPIO input to trigger Timer2 counting start via setting "Polarity" register.

3rd: Set Timer2 to Mode 2 and enable Timer2

Set address 0x620[7:6] to 2b'01 and address 0x621 [0] to 1b'1.

Timer2 Tick is triggered by a positive/negative (specified during the 2nd step) edge of GPIO pulse. Timer2 starts counting upward and Timer2 Tick value is increased by 1 on each positive edge of system clock.

While a negative/positive edge of GPIO pulse is detected, an interrupt is generated and Timer2 tick stops.

4th: Read current Timer2 Tick value to calculate GPIO pulse width

Read current Timer2 Tick value from address 0x638~0x63b.

Then GPIO pulse width is calculated as follows:

$$\text{GPIO pulse width} = \text{System clock period} * (\text{current Timer2 Tick} - \text{intial Timer2 Tick})$$

For initial Timer2 Tick value set to the recommended value of 0, then:

$$\text{GPIO pulse width} = \text{System clock period} * \text{current Timer2 Tick}.$$

Telink for customer

Distribuída no Brasil pela LRI | vendas@lri.com.br | 51 2129-3000

5.1.5 Mode3 (Tick Mode)

In Mode 3, system clock is employed.

After Timer is enabled, Timer Tick starts counting upward, and Timer Tick value is increased by 1 on each positive edge of system clock.

This mode could be used as time indicator. There will be no interrupt generated. Timer Tick keeps rolling from 0 to 0xffffffff. When Timer tick overflows, it returns to 0 and starts counting upward again.

Steps of setting Timer0 for Mode 3 is taken as an example.

1st: Set initial Tick value of Timer0

Set Initial value of Tick via address 0x630~0x633. Address 0x630 is lowest byte and address 0x633 is highest byte. It's recommended to clear initial Timer Tick value to 0.

2nd: Set Timer0 to Mode 3 and enable Timer0

Set address 0x620[2:1] to 2b'11 to select Mode 3, meanwhile set address 0x620[0] to 1b'1 to enable Timer0. Timer0 Tick starts to roll.

3rd: Read current Timer0 Tick value

Current Timer0 Tick value can be read from address 0x630~0x633.

5.1.6 Watchdog

Programmable watchdog could reset chip from unexpected hang up or malfunction.

Only Timer2 supports Watchdog.

Timer2 Tick has 32bits. Watchdog Capture has only 14bits, which consists of TMR_CTRL2 (address 0x622) [6:0] as higher bits and TMR_CTRL1 (address 0x621) [7:1] as lower bits. Chip will be reset when the Timer2 Tick[31:18] matches Watch dog capture.

1st: Clear Timer2 Tick value

Clear registers TMR_TICK2_0 ~TMR_TICK2_3 (address 0x638~0x63b). Address 0x638 is lowest byte and 0x63b is highest byte.

Telink for customer

Distribuída no Brasil pela LRI | vendas@lri.com.br | 51 2129-3000

2nd: Enable Timer2

Set register TMR_CTRL0 (address 0x620) [6] to 1b'1 to enable Timer2.

3rd: Set 14-bit Watchdog Capture value and enable Watchdog

Set address 0x622[6:0] as higher bits of watchdog capture and 0x621[7:1] as lower bits. Meanwhile set address 0x622[7] to 1b'1 to enable Watchdog.

Then Timer2 Tick starts counting upwards from 0.

If bits[31:18] of Timer2 Tick value read from address 0x638~0x63b reaches watchdog capture, the chip will be reset.

5.2 32kHz LTIMER

The TLSR8266/TLSR8266F512/TLSR8266F128/TLSR8266F1K supports a low frequency (32kHz) LTIMER in suspend mode or deep sleep mode.

This timer can be used as one kind of wakeup source. Please refer to **Section 2.5.2** for details.

5.3 System Timer

The TLSR8266/TLSR8266F512/TLSR8266F128/TLSR8266F1K also supports a System Timer.

In suspend mode, both System Timer and Timer0~Timer2 stop counting, and 32kHz Timer starts counting. When the chip restores to active mode, Timer0~Timer2 will continue counting from the number when they stops; In contrast, System Timer will continue counting from an adjusted number which is a sum of the number when it stops and an offset calculated from the counting value of 32kHz Timer during suspend mode.

Telink for customer

6 Interrupt System

6.1 Interrupt structure

The interrupting function is applied to manage dynamic program sequencing based on real-time events triggered by timers, pins and etc.

For the TLSR8266/TLSR8266F512/TLSR8266F128/TLSR8266F1K, there are 24 interrupt sources in all: 16 types are level-triggered interrupt sources (listed in address 0x640~0x641) and 8 types are edge-triggered interrupt sources (listed in address 0x642).

When CPU receives an interrupt request (IRQ) from some interrupt source, it will decide whether to respond to the IRQ. If CPU decides to respond, it pauses current routine and starts to execute interrupt service subroutine. Program will jump to certain code address and execute IRQ commands. After finishing interrupt service subroutine, CPU returns to the breakpoint and continues to execute main function.

6.2 Register configuration

Table 6- 1 Register table for Interrupt system

Address	Mnemonic	Type	Description	Reset Value
0x640	MASK_0	RW	Byte 0 interrupt mask, level-triggered type {irq_host_cmd|irq_qdec,irq_uart,irq_ks, irq_dma,usb_pwdn,time2,time1,time0} [7] irq_host_cmd|irq_qdec [6] irq_uart [5] irq_ks [4] irq_dma [3] usb_pwdn [2] time2 [1] time1 [0] time0	00
0x641	MASK_1	RW	Byte 1 interrupt mask, level-triggered type {an_irq,irq_software|irq_pwm,irq_zb_rt,irq _udc[4:0]} [7] an_irq	00

Telink for customer

Distribuída no Brasil pela LRI | vendas@lri.com.br | 51 2129-3000

Address	Mnemonic	Type	Description	Reset Value
			[6] irq_software|irq_pwm [5] irq_zb_rt [4] irq_udc[4] [3] irq_udc[3] [2] irq_udc[2] [1] irq_udc[1] [0] irq_udc[0]	
0x642	MASK_2	RW	Byte 2 interrupt mask, edge-triggered type {gpio2risc[2:0],irq_stimer,pm_irq,irq_gpio,usb_reset,usb_250us} [7] gpio2risc[2] [6] gpio2risc[1] [5] gpio2risc[0] [4] irq_stimer [3] pm_irq [2] irq_gpio [1] usb_reset [0] usb_250us	00
0x643	IRQMODE	RW	[0] interrupt enable [1] reserved (Multi-Address enable)	00
0x644	PRIO_0	RW	Byte 0 of priority 1: High priority; 0: Low priority	00
0x645	PRIO_1	RW	Byte 1 of priority	00
0x646	PRIO_2	RW	Byte 2 of priority	00
0x648	IRQSRC_0	R	Byte 0 of interrupt source	
0x649	IRQSRC_1	R	Byte 1 of interrupt source	
0x64a	IRQSRC_2	R	Byte 2 of interrupt source	

6.2.1 Enable/Mask interrupt sources

Various interrupt sources could be enabled or masked by registers MASK_0~MASK_2 (address 0x640~0x642).

6.2.2 Interrupt mode and priority

Interrupt mode is typically-used mode. Register IRQMODE (address 0x643)[0] should be set to 1b'1 to enable interrupt function.

Telink for customer

Distribuída no Brasil pela LRI | vendas@lri.com.br | 51 2129-3000

IRQ tasks could be set as High or Low priority via registers PRIO_0~PRIO_2 (address 0x644~0x646). When more than one interrupt sources assert interrupt requests at the same time, CPU will respond depending on respective interrupt priority levels. It's recommended not to modify priority setting.

6.2.3 Interrupt source flag

Three bytes in registers IRQSRC_0~IRQSRC_2 (address 0x648~0x64a) serve to indicate IRQ sources. Once IRQ occurs from certain source, the corresponding IRQ source flag will be raised to "High". User could identify IRQ source by reading address 0x648~0x64a.

When handling edge-triggered type interrupt, the corresponding IRQ source flag needs to be cleared via address 0x64a. Take the interrupt source usb_250us for example: First enable the interrupt source by setting address 0x642 bit[0] to 1; then set address 0x643 bit[0] to 1 to enable the interrupt. In interrupt handling function, 24-bit data is read from address 0x648~0x64a to determine which IRQ source is valid; if data bit[16] is 1, it means the usb_250us interrupt is valid. Clear this interrupt source by setting address 0x64a bit[0] to 1.

As for level-type interrupt, IRQ interrupt source status needs to be cleared via setting corresponding module status register. Take Timer0 IRQ interrupt source for example, register TMR_STATUS (address 0x623) [0] should be written with 1b'1 to clear Timer0 status (refer to section 5.1.1).

Telink for customer

7 Interface

7.1 GPIO

The TLSR8266ET/AT56, TLSR8266ET/AT48, TLSR8266ET/AT32, TLSR8266F512ET/AT48, TLSR8266F512ET/AT32/TLSR8266F1KET32 and TLSR8266F128ET24 support up to 41, 37, 22, 35, 20 and 12 GPIOs respectively. Except for dedicated GPIOs, all digital IOs can be used as general purpose IOs. All GPIOs have configurable pull-up/pull-down resistor. Note: For GPIO function, the USB interface (DM, DP) can only be used as GPI.

7.1.1 Basic configuration

Please refer to Table 7-1 in section 7.1.1.3 for various GPIO interface configuration.

7.1.1.1 Multiplexed functions

For a pin listed in Table 7-1, it acts as the function in the “Default Function” column by default. It’s noted that functions of higher priority should be disabled (by clearing corresponding bit) before enabling function of lower priority (by setting corresponding bit to 1b’1).

If a pin with multiplexed functions does not act as GPIO function by default, to use it as GPIO function, first set the bit in “Act as GPIO” column to 1b’1. After GPIO function is enabled, if the pin is used as output, both the bits in “IE” and “OEN” columns should be cleared, then set the register value in the “Output” column; if the pin is used as input, both the bits in “IE” and “OEN” columns set to 1b’1, and the input data can be read from the register in the “Input” column.

Take the PWM3/ANA_A<1> pin for example.

(1) The pin acts as GPIO function by default. If the pin is used as general output, both address 0x581[1] and 0x582[1] should be cleared, then configure address 0x583[1]. If the pin is used as general input, both address 0x581[1] and 0x582[1] should be set to 1b’1, and the input data can be read from address 0x580[1].

(2) To use the pin as Keyscan function, address 0x586[1] should be cleared and

Telink for customer

Distribuída no Brasil pela LRI | vendas@lri.com.br | 51 2129-3000

0x5b0[1] should be set to 1b'1.

(3) Addresses {0x586[1], 0x5b0[1], 0x5b6[4]} should be all cleared to use the pin as PWM3 function.

Take the SWS/ANA_A<0> pin as another example. The pin acts as SWS function by default. To use it as GPIO function, first set address 0x586[0] to 1b'1. If the pin is used as general output, both address 0x581[0] and 0x582[0] should be cleared, then configure address 0x583[0]. If the pin is used as general input, both address 0x581[0] and 0x582[0] should be set to 1b'1, and the input data can be read from address 0x580[0].

7.1.1.2 Drive strength

The registers in the "**DS**" column are used to configure corresponding pin's driving strength: "1" indicates maximum drive level, while "0" indicates minimal drive level. The "DS" configuration will take effect when the pin is used as output. It's set as the strongest driving level by default. In actual applications, driving strength can be decreased to lower level if necessary.

All the pins support maximum drive level of 4mA ("DS"=1) and minimal drive level of 0.7mA ("DS"=0) with the following exceptions:

- ANA_B<6> and ANA_B<5>: maximum=8mA ("DS"=1), minimum=4mA ("DS"=0)
- ANA_E<5> and ANA_E<4>: maximum=16mA ("DS"=1), minimum=12mA ("DS"=0)

7.1.1.3 GPIO lookup table

Table 7- 1 GPIO lookup table

Pin	Default Function	Prio_0	Prio_1	Prio_2	Prio_3	Prio_4	GPIO setting					
							Input (R)	IE (High active)	OEN (Low active)	Output	DS	Act as GPIO
SWS/ ANA_A<0>	SWS						0x580[0]	0x581[0]	0x582[0]	0x583[0]	0x585[0]	0x586[0]
PWM3/	GPIO	5b0[1]		5b6[4]			0x580[1]	0x581[1]	0x582[1]	0x583[1]	0x585[1]	0x586[1]

Telink for customer

*Notes:

(1) ks: key_scan.

(2) IE: Input enable (1), high active.

(3) OEN: Output enable (0), low active.

(4) Priority: acting as GPIO is the highest priority and prio0 > prio1 > prio2 > prio3 > prio4.

(5) GPIO acts as input by default except ANA_B<0> and ANA_D<5:4>: ANA_B<0> and ANA_D<4> output 1, while ANA_D<5> outputs 0.

(6) For all unused GPIOs, corresponding “IE” must be set as 0.

(7) When SWS/ANA_A<0> “IE” is set as 1, this pin must be fixed as pull-up/pull-down

state (float state is not allowed).

7.1.2 Connection relationship between GPIO and related modules

GPIO can be used to generate GPIO interrupt signal for interrupt system, counting or control signal for Timer/Counter module, or GPIO2RISC interrupt signal for interrupt system.

For the “Exclusive Or (XOR)” operation result for input signal from any GPIO pin and respective “polarity” value, on one hand, it takes “And” operation with “irq” and generates GPIO interrupt request signal; on the other hand, it takes “And” operation with “m0/m1/m2”, and generates counting signal in Mode 1 or control signal in Mode 2 for Timer0/Timer1/Timer2, or generates GPIO2RISC interrupt request signal.

GPIO interrupt request signal = | ((input ^ polarity) & irq);

Counting (Mode 1) or control (Mode 2) signal for Timer0 = | ((input ^ polarity) & m0);

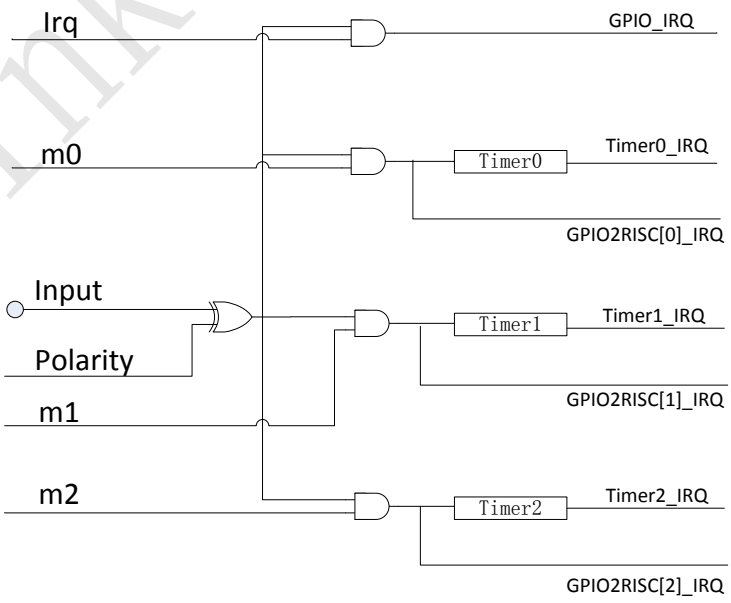

Counting (Mode 1) or control (Mode 2) signal for Timer1 = | ((input ^ polarity) & m1);

Counting (Mode 1) or control (Mode 2) signal for Timer2 = | ((input ^ polarity) & m2);

GPIO2RISC[0] interrupt request signal = | ((input ^ polarity) & m0);

GPIO2RISC[1] interrupt request signal = | ((input ^ polarity) & m1);

GPIO2RISC[2] interrupt request signal = | ((input ^ polarity) & m2);

Figure 7- 1 Logic relationship between GPIO and related modules

Please refer to Table 7-2 and Table 6- 1 to learn how to configure GPIO for interrupt system or Timer/Counter (Mode 1 or Mode 2).

(1) First enable GPIO function, IE and disable OEN.

(2) GPIO IRQ signal: Select GPIO interrupt trigger edge (positive edge or negative edge) via configuring “Polarity”, and set corresponding GPIO interrupt enabling bit “Irq”. Then set address 0x5b5[3] to enable GPIO IRQ. Finally enable GPIO interrupt (irq_gpio at address 0x642[2]).

User can read addresses 0x5e0 ~ 0x5e5 to see which GPIO asserts GPIO interrupt request signal. **Note:** 0x5e0[7:0] --> ANA_A<7>~ANA_A<0>, 0x5e1[7:0] --> ANA_B<7>~ANA_B<0>, 0x5e2[7:0] --> ANA_C<7>~ANA_C<0>, 0x5e3[7:0] --> ANA_D<7>~ANA_D<0>, 0x5e4[7:0] --> ANA_E<7>~ANA_E<0>, 0x5e5[1:0] --> ANA_F<1>~ANA_F<0>.

(3) Timer/Counter counting or control signal: Configure “Polarity” (In Mode 1， it determines GPIO edge when Timer Tick counting increases; in Mode 2, it determines GPIO edge when Timer Tick starts counting) and set “m0/m1/m2”.

User can read addresses 0x5e8~0x5ed/0x5f0~0x5f5/0x5f8~0x5fd to see which GPIO asserts counting signal (in Mode 1) or control signal (in Mode 2) for Timer0/Timer1/Timer2. **Note:** **Timer0**: 0x5e8[7:0] --> ANA_A<7>~ANA_A<0>, 0x5e9[7:0] --> ANA_B<7>~ANA_B<0>, 0x5ea[7:0] --> ANA_C<7>~ANA_C<0>, 0x5eb[7:0] --> ANA_D<7>~ANA_D<0>, 0x5ec[7:0] --> ANA_E<7>~ANA_E<0>, 0x5ed[1:0] --> ANA_F<1>~ANA_F<0>; **Timer1**: 0x5f0[7:0] --> ANA_A<7>~ANA_A<0>, 0x5f1[7:0] --> ANA_B<7>~ANA_B<0>, 0x5f2[7:0] --> ANA_C<7>~ANA_C<0>, 0x5f3[7:0] --> ANA_D<7>~ANA_D<0>, 0x5f4[7:0] --> ANA_E<7>~ANA_E<0>, 0x5f5[1:0] --> ANA_F<1>~ANA_F<0>; **Timer2**: 0x5f8[7:0] --> ANA_A<7>~ANA_A<0>, 0x5f9[7:0] --> ANA_B<7>~ANA_B<0>, 0x5fa[7:0] --> ANA_C<7>~ANA_C<0>, 0x5fb[7:0] --> ANA_D<7>~ANA_D<0>, 0x5fc[7:0] --> ANA_E<7>~ANA_E<0>, 0x5fd[1:0] --> ANA_F<1>~ANA_F<0>.

(4) GPIO2RISC IRQ signal: Select GPIO2RISC interrupt trigger edge (positive edge or negative edge) via configuring “Polarity”, and set corresponding GPIO enabling bit “m0”/“m1”/“m2”. Enable GPIO2RISC[0]/GPIO2RISC[1]/GPIO2RISC[2] interrupt, i.e. “gpio2risc[0]” (address 0x642[5]) / “gpio2risc[1]”(address 0x642[6]) /“gpio2risc[2]” (address 0x642[7]).

User can read addresses 0x5e8~0x5ed/0x5f0~0x5f5/0x5f8~0x5fd to see which GPIO asserts GPIO2RISC[0]/GPIO2RISC[1]/GPIO2RISC[2] interrupt request signal. **Note: GPIO2RISC[0]**: 0x5e8[7:0] --> ANA_A<7>~ANA_A<0>, 0x5e9[7:0] --> ANA_B<7>~ANA_B<0>, 0x5ea[7:0] --> ANA_C<7>~ANA_C<0>, 0x5eb[7:0] --> ANA_D<7>~ANA_D<0>, 0x5ec[7:0] --> ANA_E<7>~ANA_E<0>, 0x5ed[1:0] --> ANA_F<1>~ANA_F<0>; **GPIO2RISC[1]**: 0x5f0[7:0] --> ANA_A<7>~ANA_A<0>, 0x5f1[7:0] --> ANA_B<7>~ANA_B<0>, 0x5f2[7:0] --> ANA_C<7>~ANA_C<0>, 0x5f3[7:0] --> ANA_D<7>~ANA_D<0>, 0x5f4[7:0] --> ANA_E<7>~ANA_E<0>, 0x5f5[1:0] --> ANA_F<1>~ANA_F<0>; **GPIO2RISC[2]**: 0x5f8[7:0] --> ANA_A<7>~ANA_A<0>, 0x5f9[7:0] --> ANA_B<7>~ANA_B<0>, 0x5fa[7:0] --> ANA_C<7>~ANA_C<0>, 0x5fb[7:0] --> ANA_D<7>~ANA_D<0>, 0x5fc[7:0] --> ANA_E<7>~ANA_E<0>, 0x5fd[1:0] --> ANA_F<1>~ANA_F<0>.

7.1.3 Pull-up/Pull-down resistor

All GPIOs support configurable 1MΩ/10KΩ pull-up resistor or 100KΩ pull-down resistor which are all disabled by default. Analog registers afe3V_reg10<4:7>~afe3V_reg20 serve to control the pull-up/pull-down resistor for each GPIO. Please refer to Table 7-3 for details.

Take the ANA_A<0> for example: Setting analog register afe3V_reg10<5:4> to 2b'01/2b'10/2b'11 is to enable 1MΩ pull-up resistor/10KΩ pull-up resistor/100KΩ pull-down resistor respectively for ANA_A<0>; Clearing the two bits disables pull-up and pull-down resistor for ANA_A<0>.

Table 7- 3 Analog registers for pull-up/pull-down resistor control

7.2 SWM and SWS

The TLSR8266/TLSR8266F512/TLSR8266F128/TLSR8266F1K supports Single Wire interface. SWM (Single Wire Master) and SWS (Single Wire Slave) represent the master and slave device of the single wire communication system developed by Telink. The maximum data rate can be up to 2Mbps.

7.3 I2C

The TLSR8266/TLSR8266F512/TLSR8266F128/TLSR8266F1K embeds I2C hardware module, which could act as Master mode or Slave mode. I2C is a popular inter-IC interface requiring only 2 bus lines, a serial data line (SDA) and a serial clock line (SCL).

7.3.1 Communication protocol

Telink I2C module supports standard mode (100kbps), Fast-mode (400kbps) and Fast-mode plus (1Mbps) with restriction that system clock must be by at least 10x of data rate.

Two wires, SDA and SCL carry information between Master device and Slave device connected to the bus. Each device is recognized by unique address (ID). Master device is the device which initiates a data transfer on the bus and generates the clock signals to permit that transfer. Slave device is the device addressed by a master.

Both SDA and SCL are bidirectional lines connected to a positive supply voltage via a pull-up resister. It’s recommended to use the internal 10K pull-up resistor first. In

Telink for customer

Distribuída no Brasil pela LRI | vendas@lri.com.br | 51 2129-3000

order to speed up the pull-up process, user can use external pull-up resistor with smaller resistance value (e.g. 3.3K or 4.7K) instead.

When the bus is free, both lines are HIGH. It's noted that data in SDA line must keep stable when clock signal in SCL line is at high level, and level state in SDA line is only allowed to change when clock signal in SCL line is at low level.

7.3.3 I2C Slave mode

I2C module of the TLSR8266/TLSR8266F512/TLSR8266F128/TLSR8266F1K acts as Slave mode by default. I2C slave address can be configured via register I2CID (address 0x01) [7:1].

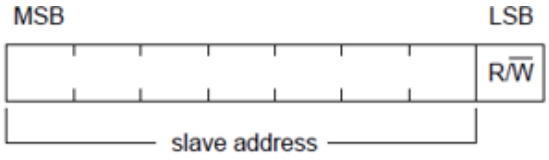

Figure 7- 3 Byte consisted of slave address and R/W flag bit

I2C slave mode supports two sub modes including Direct Memory Access (DMA) mode and Mapping mode, which is selectable via address 0x03[2].

In I2C Slave mode, Master could initiate transaction anytime. I2C slave module will reply with ACK automatically. To monitor the start of I2C transaction, user could set interrupt from GPIO for SCA or SCL.

7.3.3.1 DMA mode

In DMA mode, other devices (Master) could access (read/write) designated address in Register and/or SRAM of the TLSR8266/TLSR8266F512/TLSR8266F128/TLSR8266F1K according to I2C protocol. I2C module of the TLSR8266/TLSR8266F512/TLSR8266F128/TLSR8266F1K will execute the read/write command from I2C master automatically. But user needs to notice that the system clock shall be at least 10x faster than I2C bit rate.

The access address designated by Master is offset by 0x800000. In the TLSR8266/TLSR8266F512/TLSR8266F128/TLSR8266F1K, Register address starts from 0x800000 and SRAM address starts from 0x808000. For example, if Addr High(AddrH) is 0xaa and Addr Low (AddrL) is 0xcc, the real address of accessed data is 0x80aacc.

In DMA mode, Master could read/write data byte by byte. The designated access address is initial address and it supports auto increment by setting address 0x03[0] to 1b’1.

Read Format in DMA mode

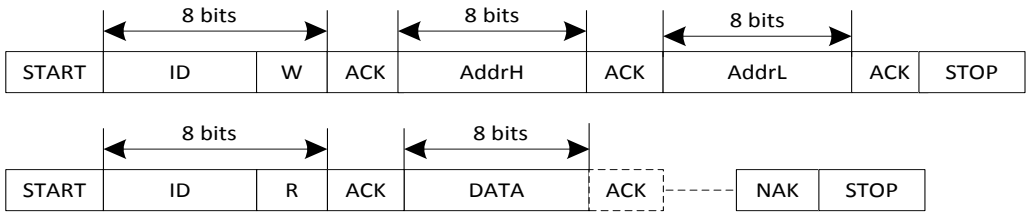

Figure 7- 4 Read format in DMA mode

Write Format in DMA mode

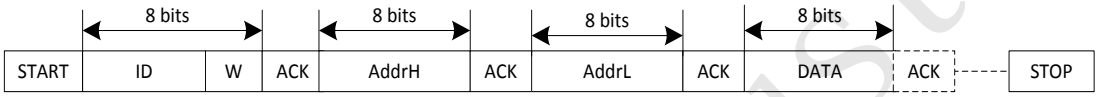

Figure 7- 5 Write format in DMA mode

7.3.3.2 Mapping mode

Mapping mode could be enabled via setting register I2CSCT (address 0x03)[2] to 1b'1.

In Mapping mode, data written and read by I2C master will be redirected to specified 128-byte buffer in SRAM. User could specify the initial address of the buffer by configuring registers reg_host_map_adrl (address 0x3e, lower byte) and reg_host_map_adrh (address 0x3f, higher byte). The first 64-byte buffer is for written data and following 64-byte buffer is for read data. Every time the data access will start from the beginning of the Write-buffer/Read-buffer after I2C stop condition occurs. The last accessed data address could be checked in register reg_host_map_status (address 0x20) [6:0] which is only updated after I2C STOP occurs.

Read Format in mapping mode

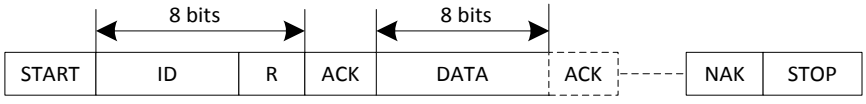

Figure 7- 6 Read format in Mapping mode

Write Format in mapping mode

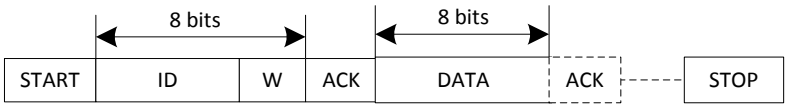

Figure 7- 7 Write format in Mapping mode

7.3.4 I2C Master mode

Address 0x03[1] should be set to 1b'1 to enable I2C master mode for the TLSR8266/TLSR8266F512/TLSR8266F128/TLSR8266F1K.

Address 0x00 serves to set I2C Master clock: F_{I2C} = (System Clock/(address 0x73[7:4]+1)) / (4 *clock speed configured in address 0x00). Since address 0x73[7:4] is set as 1 by default, the default F_{I2C} equals System Clock / (8 * address 0x00). If 0x73[7:4] is set as 0, F_{I2C} will change to System Clock / (4 * address 0x00).

A complete I2C protocol contains START, Slave Address, R/W bit, data, ACK and STOP. Slave address could be configured via address 0x01[7:1].

I2C Master could send START, Slave Address, R/W bit, data and STOP by configuring address 0x07. I2C master will send enabled cycles with correct sequence.

Address 0x02 serves to indicate whether Master/Master packet is busy, as well as Master received status. Bit[0] will be set to 1 when one byte is being sent, and the bit can be automatically cleared after a start signal/ address byte/acknowledge signal/data /stop signal is sent. Bit[1] is set to 1 when the start signal is sent, and the bit will be automatically cleared after the stop signal is sent. Bit[2] indicates whether to succeed in sending acknowledgement signal.

7.3.4.1 I2C Master Write transfer

I2C Master has 3 byte buffer for write data, which are I2CAD (0x04), I2CDW (0x05) and I2CDR (0x06). Write transfer will be completed by I2C master module.

For example, to implement an I2C write transfer with 3 byte data, which contains START, Slave Address, Write bit, ack from Slave, 1st byte, ack from slave, 2nd byte, ack from slave, 3rd byte, ack from slave and STOP, user needs to configure I2C slave

Telink for customer

LRI Distribuída no Brasil pela LRI | vendas@lri.com.br | 51 2129-3000

address to I2CID (0x01) [7:1], 1st byte data to I2CAD, 2nd byte data to I2CDW and 3rd byte to I2CDR. To start I2C write transfer, I2CCLT (0x07) is configured to 0x3f. I2C Master will launch START, Slave address, Write bit, load ACK to I2CMST (0x02) [2], send I2CAD data, load ACK to I2CMST[2], send I2CDW data, load ACK to I2CMST[2], send I2CDR data, load ACK to I2CMST[2] and then STOP sequentially.

For I2C write transfer whose data is more than 3 bytes, user could split the cycles according to I2C protocol.

7.3.4.2 I2C Master Read transfer

I2C Master has one byte buffer for read data, which is I2CDR (0x06). Read transfer will be completed by I2C Master.

For example, to implement an I2C read transfer with 1 byte data, which contains START, Slave Address, Read bit, Ack from Slave, 1st byte from Slave, Ack by master and STOP, user needs to configure I2C slave address to I2CID (0x01) [7:1]. To start I2C read transfer, I2CCLT (0x07) is configured to 0xf9. I2C Master will launch START, Slave address, Read bit, load ACK to I2CMST (0x02) [2], load data to I2CDR, reply ACK and then STOP sequentially.

For I2C read transfer whose data is more than 1 bytes, user could split the cycles according to I2C protocol.

7.3.5 I2C and SPI Usage

I2C hardware and SPI hardware modules in the chip share part of the hardware, as a result, when both hardware interfaces are used, the restrictions listed within this section need to be taken into consideration.

I2C and SPI hardware cannot be used as Slave at the same time. I2C Slave mode and SPI Master mode cannot be used at the same time. I2C Master mode and SPI Slave mode cannot be used at the same time.

I2C and SPI can be used as Master at the same time only when specific GPIO pins are configured as I2C and SPI pins, respectively. Please refer to corresponding SDK instructions for details.

7.4 SPI

The TLSR8266/TLSR8266F512/TLSR8266F1K embeds SPI (Serial Peripheral interface), which could act as Master mode or Slave mode. SPI is a high-speed, full-duplex and synchronous communication bus requiring 4 bus lines including a chip select (CS) line, a data input (DI) line, a data output (DO) line and a clock (CK) line.

7.4.1 Register table

Table 7- 5 Register configuration for SPI

Address	Name	R/W	Description	Reset Value
0x08	SPIDAT	RW	SPI data access	
0x09	SPICT	RW	[0]: p_csn [1]: enable master mode [2]: spi data output disable [3]: 1 for read command; 0 for write command [4]: address auto increase [5]: share_mode [6]: busy status	11
0x0a	SPISP	RW	[6:0]: SPI clock speed [7]: SPI function mode, p_csn, p_scl, p_sda and p_sdo function as SPI if 1	05
0x0b	SPIMODE	RW	[0]: inverse SPI clock output [1]: dat delay half clk	0
0x0c	MSPIDAT	RW	Memory SPI data access	
0x0d	MSPICT	RW	[0]: p_mcsn [1]: rsvd [2]: continuous mode	11

			[3]: 1 for read command; 0 for write command [4]: address auto increase	
0x0e	MSPIRA	RW	Memory SPI read command ID	0b
0x0f	MSPIMODE	RW	[0]: dual data mode [1]: dual address mode [7:2]: MSPI clock speed	0

7.4.2 SPI Master mode

SPI for the TLSR8266/TLSR8266F512/TLSR8266F1K supports both master mode and slave mode and acts as slave mode by default. Address 0x09 bit[1] should be set to 1b'1 to enable SPI Master mode.

Register SPISP is to configure SPI pin and clock: setting address 0x0a bit[7] to 1 is to enable SPI function mode, and corresponding pins can be used as SPI pins; SPI clock = system clock/((clock speed configured in address 0x0a bit[6:0] +1)*2).Address 0x08 serves as the data register. One reading/writing operation of 0x08 enables the SPI_CK pin to generate 8 SPI clock cycles.

Telink SPI supports four standard working modes: Mode 0~Mode 3. Register SPIMODE (address 0x0b) serves to select one of the four SPI modes:

Table 7- 6 SPI mode

SPI mode	CPOL/CPHA	SPIMODE register (Address 0x0b)
Mode 0	CPOL=0, CPHA=0	bit[0]=0, bit[1]=0
Mode 1	CPOL=0, CPHA=1	bit[0]=0, bit[1]=1
Mode 2	CPOL=1, CPHA=0	bit[0]=1, bit[1]=0
Mode 3	CPOL=1, CPHA=1	bit[0]=1, bit[1]=1
CPOL: Clock Polarity When CPOL=0, SPI_CLK keeps low level in idle state; When CPOL=1, SPI_CLK keeps high level in idle state.		

Telink for customer

Distribuída no Brasil pela LRI | vendas@lri.com.br | 51 2129-3000

SPI mode	CPOL/CPHA	SPIMODE register (Address 0x0b)
CPHA: Clock Phase When CPHA=0, data is sampled at the first edge of clock period When CPHA=1, data is sampled at the latter edge of clock period		

Address 0x09 bit[0] is to control the CS line: when the bit is set to 1, the CS level is high; when the bit is cleared, the CS level is low. Address 0x09 bit[2] is the disabling bit for SPI Master output. When the bit is cleared, MCU writes data into address 0x08, then the SPI_DO pin outputs the data bit by bit during the 8 clock cycles generated by the SPI_CK pin. When the bit is set to 1b'1, SPI_DO output is disabled.

Address 0x09 bit[3] is the enabling bit for SPI Master reading data function. When the bit is set to 1b'1, MCU reads the data from address 0x08, then the input data from the SPI_DI pin is shifted into address 0x08 during the 8 clock cycles generated by the SPI_CK pin. When the bit is cleared, SPI Master reading function is disabled. Address 0x09[5] is the enabling bit for share mode, i.e. whether SPI_DI and SPI_DO share one common line.

Users can read address 0x09 bit[6] to get SPI busy status, i.e. whether the 8 clock pulses have been sent.

7.4.3 SPI Slave mode

SPI for the TLSR8266/TLSR8266F512/TLSR8266F1K acts as slave mode by default. SPI Slave mode support DMA. User could access registers of the TLSR8266/TLSR8266F512/TLSR8266F1K by SPI interface. It's noted that system clock of TLSR8266/TLSR8266F512/TLSR8266F1K shall be at least 5x faster than SPI clock for reliable connection. Address 0x0a should be written with data 0xa5 by the SPI host to activate SPI slave mode.

Address 0x09[4] is dedicated for SPI Slave mode and indicates address auto increment. SPI write command format and read command format are illustrated in Figure 7-8:

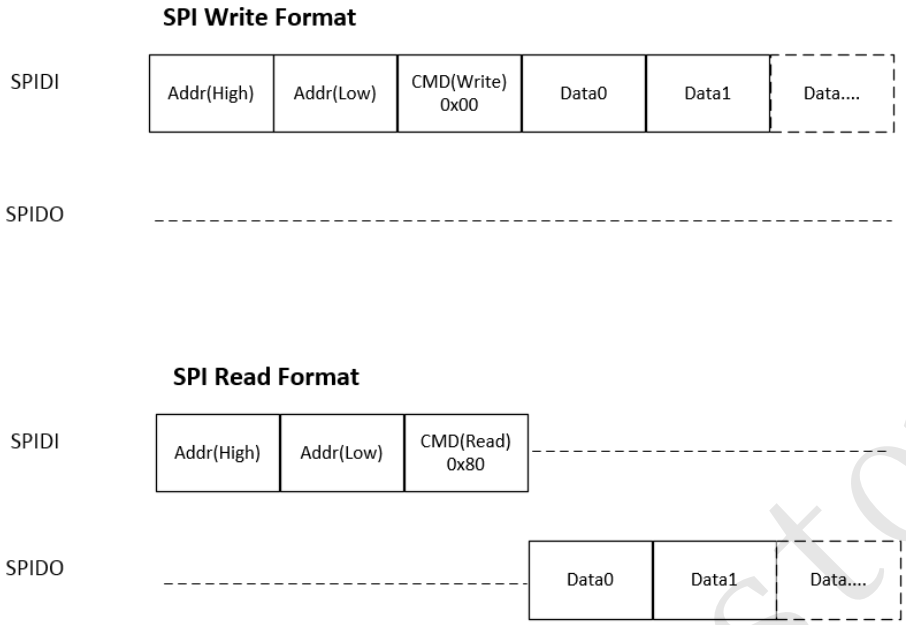

Figure 7- 8 SPI write/read command format

7.4.4 I2C and SPI Usage

I2C hardware and SPI hardware modules in the chip share part of the hardware, as a result, when both hardware interfaces are used, certain restrictions apply. See **Section 7.3.5 I2C and SPI Usage** for detailed instructions.

7.5 UART

The TLSR8266/TLSR8266F512/TLSR8266F128/TLSR8266F1K embeds UART (Universal Asynchronous Receiver/Transmitter) to implement full-duplex transmission and reception. Both TX and RX interface are 4-layer FIFO (First In First Out) interface. Hardware flow control is also supported by the TLSR8266/TLSR8266F512/ TLSR8266F1K via RTS and CTS (Note: TLSR8266F128 UART does not support hardware flow control since the RTS and CTS interface are not available).

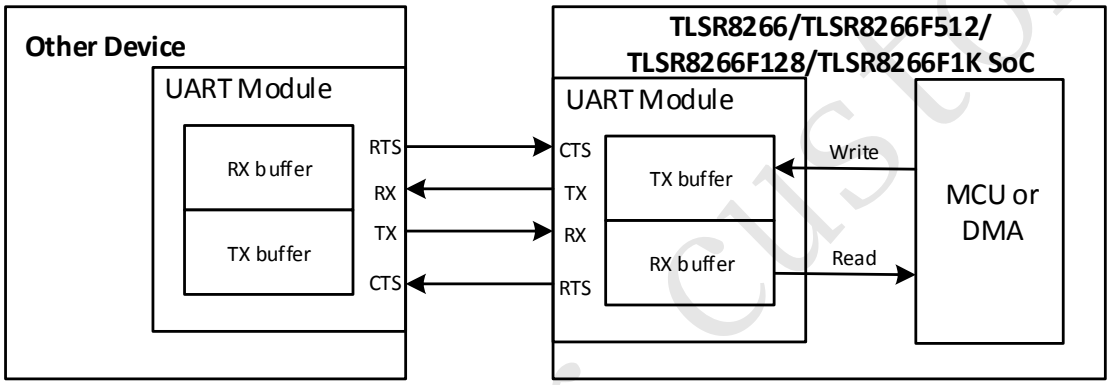

Figure 7- 9 UART communication

As shown in Figure 7-9, data to be sent is first written into TX buffer by MCU or DMA, then UART module transmits the data from TX buffer to other device via pin TX. Data to be read from other device is first received via pin RX and sent to RX buffer, then the data is read by MCU or DMA.

If RX buffer of the TLSR8266/TLSR8266F512/TLSR8266F1K UART is close to full, the TLSR8266/TLSR8266F512/TLSR8266F1K will send a signal (configurable high or low level) via pin RTS to inform other device that it should stop sending data. Similarly, if the TLSR8266/TLSR8266F512/TLSR8266F1K receives a signal from pin CTS, it indicates that RX buffer of other device is close to full and the TLSR8266/TLSR8266F512/TLSR8266F1K should stop sending data.

Addresses 0x90~0x93 serve to write data into TX buffer or read data from RX buffer.

Addresses 0x94~0x95 serve to configure UART clock.

Address 0x96 serves to set baud rate (bit[3:0]), enable RX/TX DMA mode (bit[4:5]), and enable RX/TX interrupt (bit[6:7]).

Address 0x97 mainly serves to configure CTS. Bit[1] should be set to 1b'1 to enable CTS. Bit[0] serves to configure CTS signal level. Bit[2:3] serve to enable parity bit and select even/odd parity. Bit[5:4] serve to select 1/1.5/2 bits for stop bit. Bit[6] serves to configure whether RX/TX level should be inverted.

Address 0x98 serves to configure RTS. Bit[7] and Bit[3:0] serve to enable RTS and configure RTS signal level.

Address 0x99 serves to configure the number of bytes in RX/TX buffer to trigger interrupt.

The number of bytes in RX/TX buffer can be read from address 0x9c.

8 PWM

The TLSR8266/TLSR8266F512/TLSR8266F128/TLSR8266F1K supports up to 6-channel PWM (Pulse-Width-Modulation) output depending on package option. Each PWM#n has its corresponding inverted output at PWM#n_Npin.

8.2 Enable PWM

Register PWM_EN (address 0x780)[5:0] serves to enable PWM5~PWM0 respectively via writing “1” for the corresponding bits.

8.3 Set PWM clock

PWM clock derives from system clock. Register PWM_CLK (address 0x781) serves to set the frequency dividing factor for PWM clock. Formula below applies:

$$F_{PWM} = F_{System\ clock} / (PWM_CLK+1)$$

8.4 PWM waveform, polarity and output inversion

Each PWM channel has independent counter and 3 status including “Delay”, “Count” and “Remaining”. Count and Remaining status form a signal frame.

8.4.1 PWM waveform

When PWM#n is enabled, PWM#n enters Delay status. By default PWM#n outputs Low level at Delay status. The Delay status duration, i.e. Phase time, is

Telink for customer

Distribuída no Brasil pela LRI | vendas@lri.com.br | 51 2129-3000

configured in register PWM_PHASE#n (address 0x788~0x793). Phase difference between PWM channels is allowed by different phase time configuration.

After Phase time expires, PWM#n exits Delay status and starts to send signal frames. First PWM#n is at Count status and outputs High level signal by default. When PWM#n counter reaches cycles set in register PWM_TCMP#n (address 0x794~0x795, 0x798~0x799, 0x79c~0x79d, 0x7a0~0x7a1, 0x7a4~0x7a5, 0x7a8~0x7a9), PWM#n enters Remaining status and outputs Low level till PWM#n cycle time configured in register PWM_TMAX#n (address 0x796~0x797, 0x79a~0x79b, 0x79e~0x79f, 0x7a2~0x7a3, 0x7a6~0x7a7, 0x7aa~0x7ab) expires.

An interruption will be generated at the end of each signal frame if enabled via register PWM_MASK (address 0x7b0[2:7]).

8.4.2 Invert PWM output

PWM#n and PWM#n_N output could be inverted independently via register PWM_CC0 (address 0x783) and PWM_CC1 (address 0x784). When the inversion bit is enabled, the corresponding PWM channel waveform will be inverted completely.

8.4.3 Polarity for signal frame

By default, PWM#n outputs High level at Count status and Low level at Remaining status. When the corresponding polarity bit is enabled via register PWM_CC2 (address 0x785), PWM#n will output Low level at Count status and High level at Remaining status.

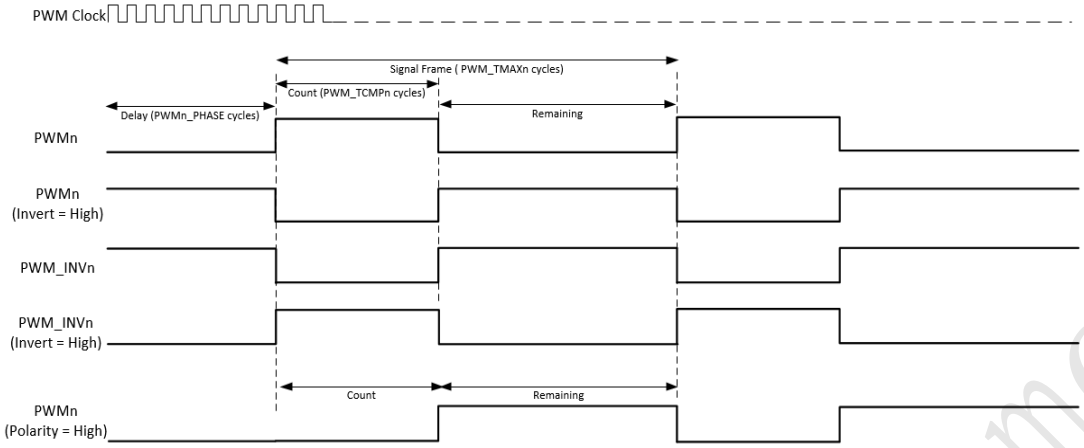

Figure 8- 1 PWM output waveform chart

8.5 PWM mode

8.5.1 Select PWM mode

PWM0 and PWM1 support 3 modes, including Continuous (normal) mode, Counting mode, and IR mode. PWM2~PWM5 only support Continuous mode.

Register PWM_MODE (address 0x782) serves to select PWM0/PWM1 mode.

8.5.2 Continuous mode

PWM0~PWM5 all support Continuous mode. In this mode, PWM#n continuously sends out signal frames. PWM#n should be disabled via address 0x780 to stop it; when stopped, the PWM output will turn low immediately.

During Continuous mode, waveform could be changed freely. New configuration for PWM_TCMP#n and PWM_TMAX#n will take effect in the next signal frame.

A frame interruption will be generated (if enabled) after each signal frame is finished.

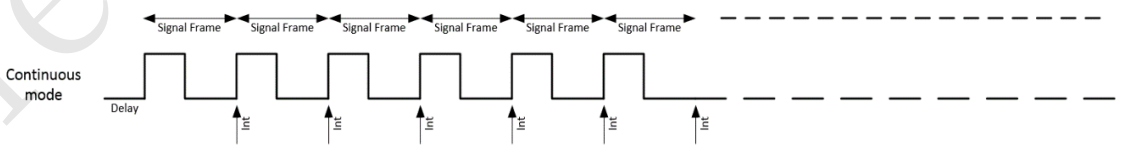

Figure 8-2 Continuous mode

Telink for customer

Distribuída no Brasil pela LRI | vendas@lri.com.br | 51 2129-3000

8.5.3 Counting mode

Only PWM0 and PWM1 support Counting mode. In this mode, PWM#n (n=0,1) sends out specified number of signal frames which is defined as a pulse group. The number is configured via register PWM_PNUM0 (address 0x7ac~0x7ad) and PWM_PNUM1 (address 0x7ae~0x7af). After a pulse group is finished, PWM#n will be disabled automatically, and a Pnum interruption will be generated if enabled via register PWM_MASK (address 0x7b0[0:1]).

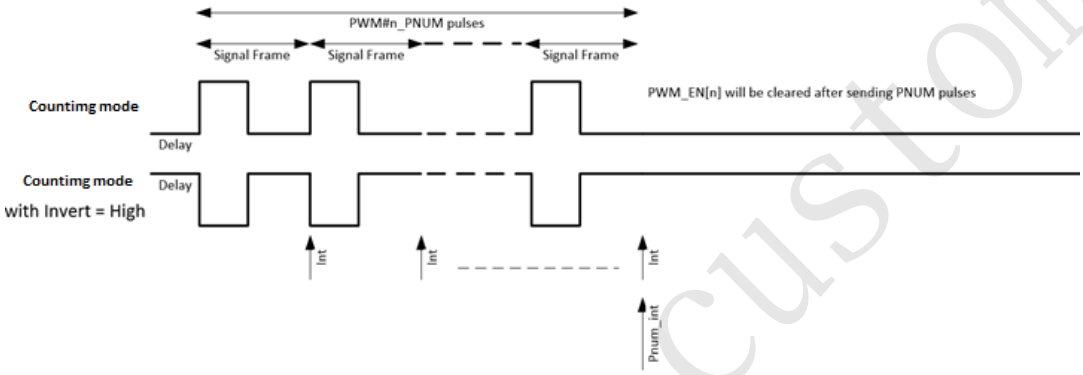

Figure 8-3 Counting mode

Counting mode also serves to stop IR mode gracefully. Refer to **section 8.5.4** for details.

8.5.4 IR mode

Only PWM0 and PWM1 support IR mode. In this mode, specified number of frames is defined as one pulse group. In contrast to Counting mode where PWM#n (n=0,1) stops after first pulse group finishes, PWM#n will constantly send pulse groups in IR mode.

During IR mode, waveform could also be changed freely. New configuration for PWM_TCMP#n and PWM_TMAX#n will take effect in the next pulse group.

To stop IR mode and complete current pulse group, user can switch PWM#n from IR mode to Counting mode so that PWM#n will stop after current pulse group is finished. If PWM#n is disabled directly via PWM_EN (0x780[0:1]), PWM#n output will turn Low immediately despite of current pulse group.

Telink for customer

A frame interruption/Pnum interruption will be generated (if enabled) after each signal frame/pulse group is finished.

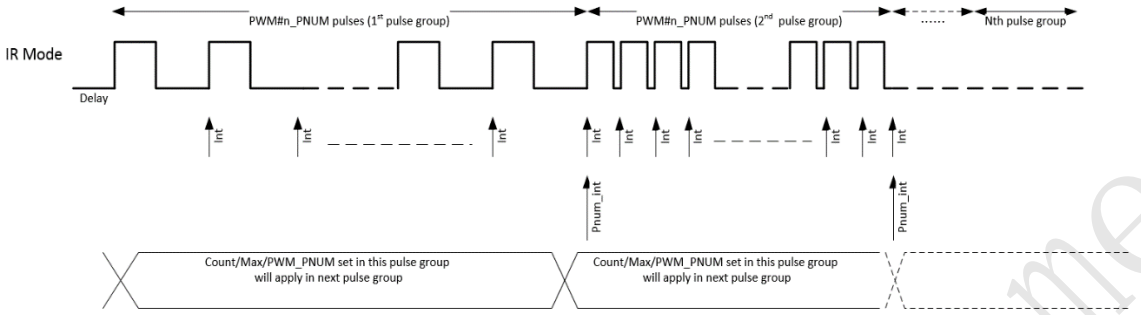

Figure 8-4 IR mode

8.6 PWM interrupt

There are 8 interrupt sources from PWM function. After each signal frame, PWM#n will generate a frame-done IRQ (Interrupt Request) signal. In Counting mode and IR mode, PWM0/PWM1 will generate a Pnum IRQ signal after completing a pulse group. Interrupt status can be cleared via register PWM_INT (address 0x7b1).

9.2 Keyscan enable

Address 0x80a[0] should be set to 1b'1 to enable Keyscan module.

Keyscan module is using 32kHz clock, which could be enabled by setting address 0x80a[1] to 1b'1.

To enable Keyscan interrupt, both 0x80a[2] and corresponding keyscan interrupt mask bit should be set to 1b'1.

9.3 Keyscan IO configuration

Users must assign IOs for Rows and Columns to use Keyscan Module. There are up to 29 pins which can be configured as either Keyscan Column IOs or Row IOs. Refer to Table 9-1 to find out available pins. Other multiplexing functions with higher priority of these pins must be disabled.

Registers KS_COL_MSK0~KS_COL_MSK3 (address 0x800~0x803) serve to configure IOs for Columns. Mask bits corresponding to IOs needed for Columns should be enabled, while other mask bits should be disabled.

Table 9- 2 IO configuration for Columns

Pin	Column IO configuration	Scanned Column number in FIFO

9.4 Keyscan flow and frame

By default Keyscan module is in idle status with clock gated to save power. Once Keyscan module is triggered by positive/negative edges, which could be configured by address 0x80a[3], Keyscan module enters scan mode and clock is ungated. Keyscan module starts to scan Rows and Columns frame by frame. After completion of each non-empty (with key press scanned) and empty frame (with no key press scanned) in scan mode, interrupt request signal is asserted and address 0x80c[0] will be raised to high.

Keyscan module will enter idle mode from scan mode after specified number of empty frames. The number can be set in KS_FRM_NUM (address 0x80b) and it is recommended to be larger than 2. Keyscan module will enter scan mode if triggered again. Keyscan module keeps working until enabling bit (address 0x80a[0]) is disabled, which could only be cleared manually.

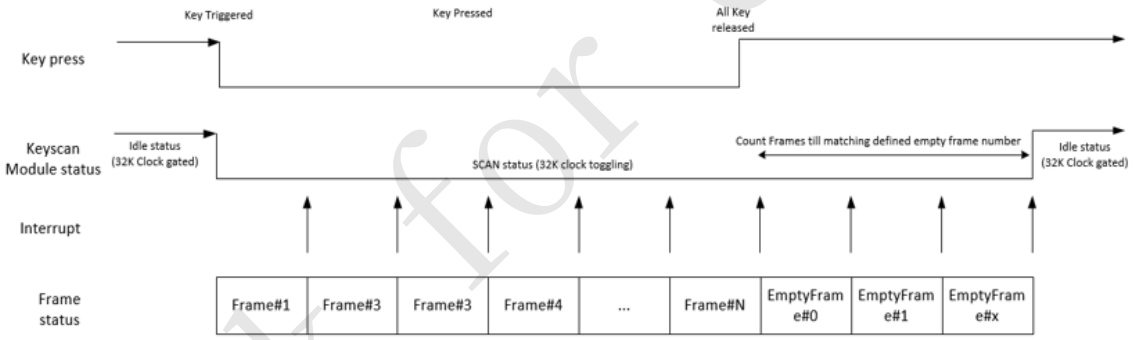

Figure 9- 1 Keyscan flow and frame

In each frame, Keyscan module scans row-by-row. Each Row scan takes 16 cycles. Each frame takes 128 (8*16) cycles. With 32kHz clock, each frame takes around 4ms. Scanned key matrix is stored in KS_KEY FIFO buffer.

9.5 Keyscan FIFO buffer

KS_KEY (address 0x810) is a 16bytes FIFO ring buffer. The higher 3 bits of each byte indicate Row number and lower 5 bits indicates Column number. End flag, which could be assigned in KS_END_FLG (address 0x809), will be inserted into buffer once each frame completes even if there is no key scanned. KS_WPTR (address 0x80e) keeps rolling while scanning is ongoing. To fetch stored key matrix, user could read data between read pointer (KS_RPTR 0x80d[7:4]) and latched write pointer (KS_RPTR 0x80d [3:0]). Latched writer pointer updates after each frame completes.

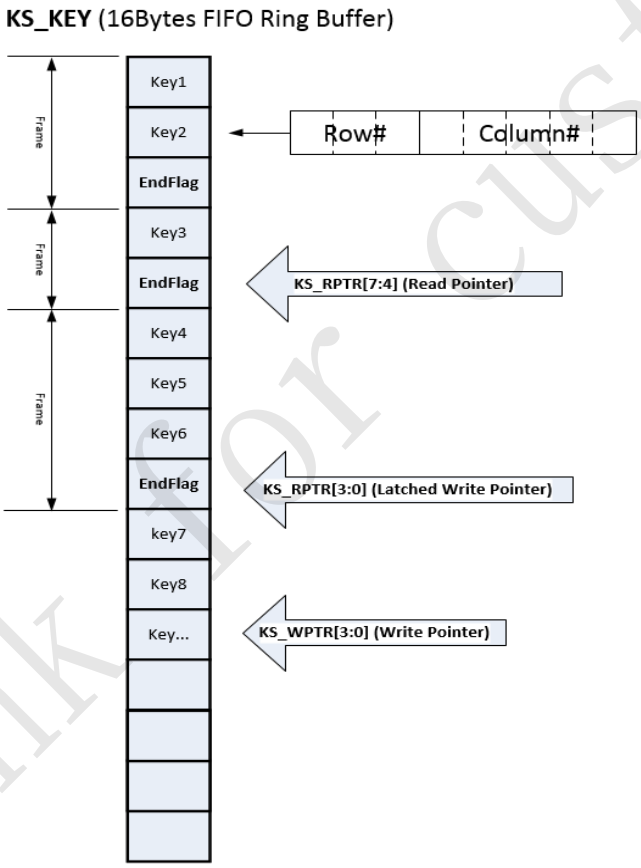

Figure 9- 3 Keyscan FIFO buffer

10 Quadrature Decoder

The TLSR8266/TLSR8266F512/TLSR8266F128/TLSR8266F1K supports three quadrature decoders (QDEC) which are designed mainly for applications such as wheel. Each QDEC implements debounce function to filter out jitter on the two phase inputs, and generates smooth square waves for the two phase.

QDEC0~ QDEC2 correspond to channels 0~2 respectively. In this section, QDEC0 corresponding to channel 0 is introduced in detail as an example.

10.1 Input pin selection

The QDEC0 supports two phase input; each input is selectable from the 32 pins of PortE, PortD, PortC and PortA via setting address 0xd4[4:0] (for channel a)/0xd5[4:0] (for channel b).

Table 10- 1 Input pin selection

Address 0xd4[4:0]	Pin
0	ANA_E<0>
1	ANA_E<1>
2	ANA_E<2>
3	ANA_E<3>

30	ANA_A<6>
31	ANA_A<7>

10.2 Common mode and double accuracy mode

Address 0xdd serves to select common mode or double accuracy mode.

For each wheel rolling step, two pulse edges (rising edge or falling edge) are generated.

If address 0xdd[0] is cleared to select common mode, the COUNT0 (i.e. counter of QDEC0) value is increased/decreased by 1 only when the same rising/falling edges are detected from the two phase signals. COUNT0 value is cleared once read from address 0xd0.

Telink for customer

Distribuída no Brasil pela LRI | vendas@lri.com.br | 51 2129-3000

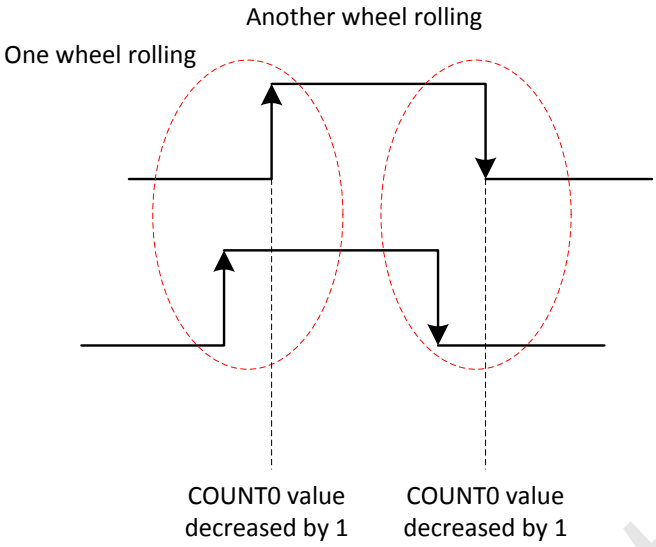

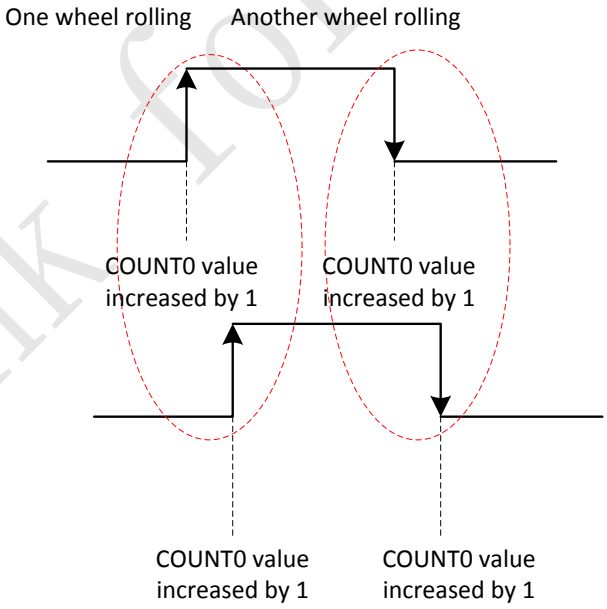

Figure 10- 1Common mode

If address 0xdd[0] is set to 1b'1 to select double accuracy mode, the COUNT0 (i.e. counter of QDEC0) value is increased/decreased by 1 on each rising/falling edge of the two phase signals; the COUNT0 will be increased/decreased by 2 for one wheel rolling.

Telink for customer

Distribuída no Brasil pela LRI | vendas@lri.com.br | 51 2129-3000

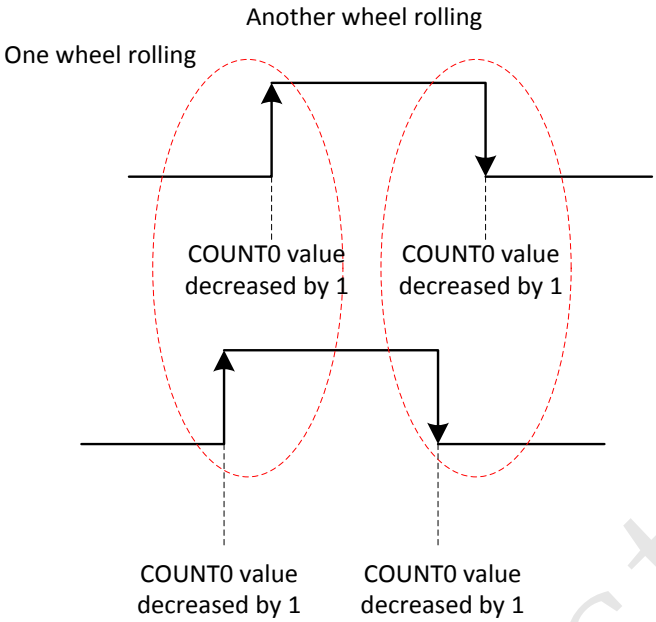

Figure 10- 2 Double accuracy mode

10.3 QDEC interrupt

Address 0xda[0] serves to enable or mask QDEC interrupt.

If address 0xda[0] is set to 1b'1 to enable QDEC interrupt, whenever counter value changes, an QDEC IRQ is asserted and address 0xdb[0] is set to 1b'1 automatically. Writing 1b'1 to address 0xdb[0] can clear the interrupt flag bit.

10.4 QDEC reset

Address 0xdc[0] serves to reset the QDECs. All counter values are cleared to zero.

10.5 Other configuration

The QDEC supports hardware debouncing. Address 0xd3[3:0] serves to set filtering window duration. All jitter with period less than the value will be filtered out and thus does not trigger count change.

Address 0xd3[4] serves to set input signal initial polarity.

Telink for customer

Distribuída no Brasil pela LRI | vendas@lri.com.br | 51 2129-3000

Address 0xd3[7:5] serves to enable shuttle mode. Shuttle mode allows non-overlapping two phase signals as shown in the following figure.

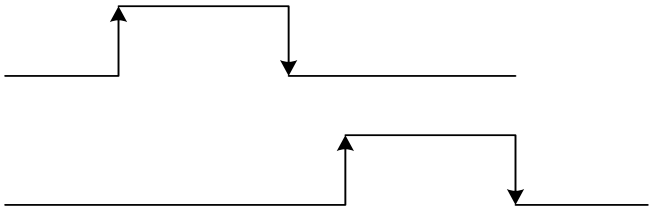

Figure 10- 3 Shuttle mode

11 ADC

The TLSR8266/TLSR8266F512/TLSR8266F128/TLSR8266F1K integrates one ADC module, which can be used to sample battery voltage, temperature sensor and external analog input.

11.1 ADC clock

ADC clock derives from FHS. Please refer to **section 4.4.1** for ADC clock configuration.

Note: ADC clock must be lower than 5M when ADC reference voltage is selected as AVDD and must be lower than 4M when ADC reference voltage is selected as 1.4V.

11.2 Set period

In general, the ADC Control Module in Telink MCU divides the whole sampling and conversion process into three parts via time-division: Misc corresponding to auto channel 0, L (Left) corresponding to auto channel 1, and R (Right) corresponding to auto channel 2.

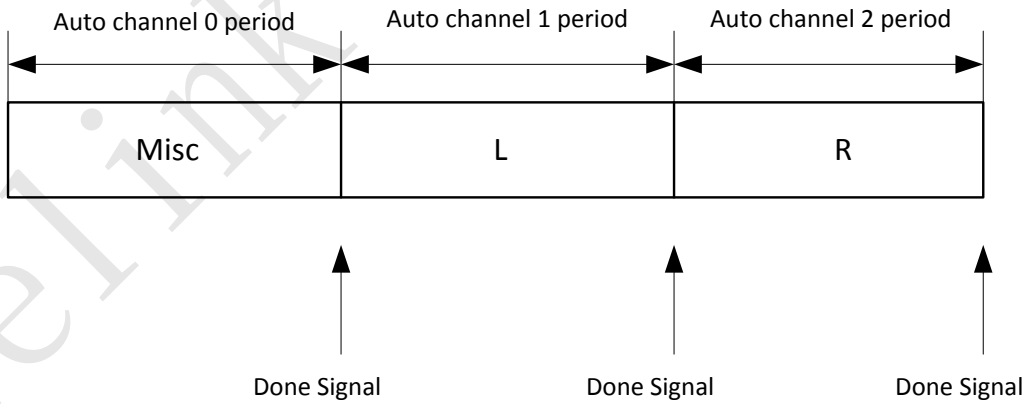

Figure 11- 1 Sampling and analog-to-digital conversion process

In TLSR8266/TLSR8266F512/TLSR8266F128/TLSR8266F1K, only Misc channel is supported.

Telink for customer

Distribuída no Brasil pela LRI | vendas@lri.com.br | 51 2129-3000

Addresses 0x30 and 0x31 serve to set lower byte and higher byte of the period (Sampling time plus converting time) for Misc:

Period of Misc = {ADCMAXMH, ADCMAXML} * system clock period.

Since the TLSR8266/TLSR8266F512/TLSR8266F128/TLSR8266F1K doesn't support audio input, address 0x33[5:4] shall always be set as 2b'00 to skip the period for L (Left) and R (Right) channel, i.e., Auto channel 1&2.

11.3 Select ADC input range

Address 0x2b[1:0] serves to set reference voltage for Misc: 1.4V or AVDD.

ADC maximum input range is the same as the ADC reference voltage.

11.4 Select resolution and sampling time

Address 0x3c[5:3] serves to set resolution for Misc: 7, 9, 10, 11, 12, 13, 14bits. ADC data format is always 14bit no matter the conversion bit is set. For example, 12 bits resolution indicates higher 12 bits are valid bits and the lower 2 bits are invalid bits.

Address 0x3c[2:0] serves to set sampling time for Misc: 3, 6, 9, 12, 18, 24, 48 or 144 * ADC clock period. The lower sampling cycle, the shorter ADC convert time.

11.5 Select input mode and channel

The ADC supports two input modes and up to 12 input channels.

Address 0x2c serves to select input mode and channel for Misc.

Address 0x2c[6:5] serves to select differential mode or single-end input mode for Misc.

When address 0x2c[6:5] is set as 2b'00 to select single-end mode, 0x2c[4:0] serves to select input channel.

When address 0x2c[6:5] is set as 2b'01/10/11, differential input mode is selected, the corresponding channel identified by address 0x2c[6:5] is selected as negative

Telink for customer

Distribuída no Brasil pela LRI | vendas@lri.com.br | 51 2129-3000

input, and the positive input is selectable via address 0x2c[4:0]. For example, if address 0x2c is set as 0x21 (i.e. 8b'00100001), ANA_D<0> and ANA_D<5> are selected as positive-end and negative-end input of differential mode; actual input signal for ADC is the difference of $V_{ANA_D<0>}$ and $V_{ANA_D<5>}$ (i.e. $V_{ANA_D<0>}$ minus $V_{ANA_D<5>}$).

11.6 Enable auto mode and output

Address 0x33[3] serves to enable Misc auto sampling and conversion mode. If address 0x33 is set as "0x10" (i.e. 8b'00010000) to select manual mode, one operation of writing address 0x35 with data "0x80" manually starts a sampling and conversion process.

Address 0x33[2] should be set as 1b'0 to disable ADC audio output, and 0x33[5:4] should be set as 2b'00 to select "no audio".

Address 0x2c[7] serves to set data format during Misc period. Real time output data can be read from addresses 0x38~0x39.

11.7 ADC done signal

ADC done signal is selectable via address 0x33[7:6]. Generally 0x33[7:6] is set to "2b'01" (or 2b'11) to select "rising" method, which means a rising edge of "ADC Valid" signal indicates one analog-to-digital conversion process is done.

11.8 ADC status

ADC busy flag bit, i.e. address 0x3a[0], indicates whether ADC is busy.

Telink for customer

12 PGA

The TLSR8266/TLSR8266F512/TLSR8266F128/TLSR8266F1K integrates a PGA (Programmable Gain Amplifier) module.

The PGA serves to amplify the input signals from specified pins before ADC sampling.

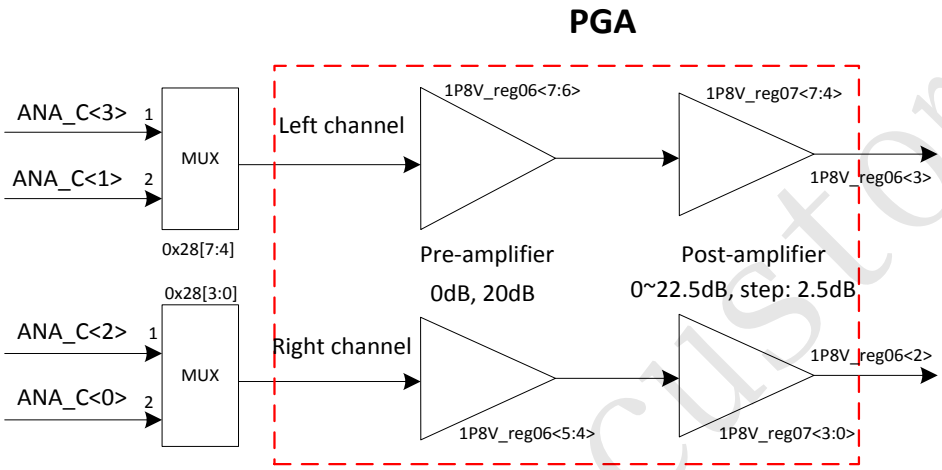

Figure 12- 1 PGA block diagram

12.1 Left/Right channel enabling

The PGA supports two channels including left channel and right channel.

Analog register 1P8V_reg06<1> serves to enable/disable left and right channel of PGA at the same time.

12.2 Input channel selection

Input channel for PGA left channel is selectable via digital register 0x28[7:4]: ANA_C<3>, ANA_C<1>.

Input channel for PGA right channel is selectable via digital register 0x28[3:0]: ANA_C<2>, ANA_C<0>.

Telink for customer

Distribuída no Brasil pela LRI | vendas@lri.com.br | 51 2129-3000

12.3 Gain setting

The PGA left/right channel consists of two stages of amplifiers. Each stage has configurable gain. For pre-amplifier, there are two gain options: 0dB, 20dB. For post-amplifier, gain is configurable from 0dB to 22.5dB with step of 2.5dB.

Analog register 1P8V_reg06<7:6> serves to set the gain of pre-amplifier for PGA left channel.

Analog register 1P8V_reg07<7:4> serves to set the gain of post-amplifier for PGA left channel.

Analog register 1P8V_reg06<5:4> serves to set the gain of pre-amplifier for PGA right channel.

Analog register 1P8V_reg07<3:0> serves to set the gain of post-amplifier for PGA right channel.

12.4 PGA output

Analog register 1P8V_reg06<3, 2> serve to enable/disable PGA left/right channel output respectively.

12.5 Register table

Table 12- 1 Analog register table related to PGA

Address	Mnemonic	Default Value	Description
1P8V_reg06<1>	pga_PD_R&L	1	Power down right and left channel PGA 1: Power down 0: Enable Default: 1
1P8V_reg06<2>	pga_MuteR	1	Mute right channel PGA 1: Mute 0: Unmute Default: 1
1P8V_reg06<3>	pga_MuteL	1	Mute left channel PGA 1: Mute

13 Key Electrical Specifications

13.1 Absolute maximum ratings

Table 13- 1 Absolute Maximum Ratings

Characteristics	Sym.	Min.	Max	Unit	Test Condition
Supply Voltage	V_{Bus}	-0.5	6.5	V	Only VBUS pin is tested, and all VDD pins leave open
	VDD	-0.3	3.9	V	All AVDD and DVDD pin must have the same voltage
Voltage on Input Pin	V_{In}	-0.3	VDD+ 0.3	V	
Output Voltage	V_{Out}	0	VDD	V	
Storage temperature Range	T_{Str}	-65	150	°C	
Soldering Temperature	T_{Sld}		260	°C	

CAUTION: Stresses above those listed in "Absolute Maximum Ratings" may cause permanent damage to the device. This is a stress only rating and operation of the device at these or any other conditions above those indicated in the operational sections of this specification is not implied.

13.2 Recommended operating condition

Table 13- 2 Recommended operation condition

Item	Sym.	Min	Typ.	Max	Unit	Condition
Chip Power-supply Voltage	VDD	1.9	3.3	3.6	V	With external flash
		2.7	3.3	3.6	V	With internal flash
	V_{Bus}	4.5	5.0	5.5	V	
Supply rise time (from 1.6V to 2.8V)	t_R			0.5	ms	
Operating Temperature Range	T_{Opr}	-40		85	°C	ET versions
		-40		125	°C	AT versions

13.3 DC characteristics

Table 13- 3 DC characteristics

Item	Sym.	Min	Typ.	Max	Unit	Condition
Tx current	I_{Tx}	-	13	-	mA	Continuous Tx transmission, 0dBm output power
		-	19	-	mA	Continuous Tx transmission, maximum output power
Rx current	I_{Rx}	-	13	-	mA	Continuous Rx reception
Suspend Current	I_{Susp}	-	20	-	uA	IO wakeup
	I_{Susp}	-	22	-	uA	Timer wakeup
Deep sleep current	I_{Deep}	-	0.7	-	uA	

*Note: All tests above are done at room temperature (T=25℃).

13.4 AC characteristics

Table 13- 4 AC Characteristics

Item	Sym.	Min	Typ.	Max	Unit	Condition
Digital inputs/outputs						
Input high voltage	VIH	0.7VDD		VDD	V	
Input low voltage	VIL	VSS		0.3VDD	V	
Output high voltage	VOH	VDD-0.3		VDD	V	
Output low voltage	VOL	VSS		0.3	V	
USB characteristics						
USB Output Signal Cross-over Voltage	V_{Crs}	1.3	-	2.0	V
